3.14.2e	Monitor organizational systems and system components on an ongoing basis for anomalous or suspicious behavior.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
3.14.6e	Use threat indicator information and effective mitigatio ns obtained from [Assignment: organization-defined external organizat ions] to guide and inform intrusion detection and threat hunting.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.14.7e	Verify the correctness of [Assignment: organization-defined security critical or essential software, firmware, and hardware components] using [Assignment: organization-defined verification methods or techniques].	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.14.7e	Verify the correctness of [Assignment: organization-defined security critical or essential software, firmware, and hardware components] using [Assignment: organization-defined verification methods or techniques].	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
3.14.7e	Verify the correctness of [Assignment: organization-defined security critical or essential software, firmware, and hardware components] using [Assignment: organization-defined verification methods or techniques].	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.14.7e	Verify the correctness of [Assignment: organization-defined security critical or essential software, firmware, and hardware components] using [Assignment: organization-defined verification methods or techniques].	ecs-fargate-latest-platform-version	Security updates and patches are deployed automatically for your AWS Fargate tasks. If a security issue is found that affects an AWS Fargate platform version, AWS patches the platform version. To assist in patch management of your Amazon Elastic Container Service (ECS) tasks running AWS Fargate, update your services standalone tasks to use the most recent platform version.

Control ID	Control Description	AWS Config Rule	Guidance
3.14.7e	Verify the correctness of [Assignment: organization-defined security critical or essential software, firmware, and hardware components] using [Assignment: organization-defined verification methods or techniques].	ecr-private-image-scanning-enabled	Amazon Elastic Container Repository (ECR) image scanning assists in identifying software vulnerabilities in your container images. Enabling image scanning on ECR repositories adds a layer of verification for the integrity and safety of the images being stored.

Template

The template is available on GitHub: Operational Best Practices for NIST 800 172.

Operational Best Practices for NIST 800 181

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the NIST 800 181 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more NIST 800 181 controls. A NIST 800 181 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

Control ID	Control Description	AWS Config Rule	Guidance
T0008	Analyze and plan for anticipated changes in data capacity requirements.	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
T0008	Analyze and plan for anticipated changes in data capacity requirements.	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business

Control ID	Control Description	AWS Config Rule	Guidance
			and regulatory backup compliance requirements.
T0008	Analyze and plan for anticipated changes in data capacity requirements.	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
T0008	Analyze and plan for anticipated changes in data capacity requirements.	dynamodb-throughput-limit-check	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0008	Analyze and plan for anticipated changes in data capacity requirements.	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0008	Analyze and plan for anticipated changes in data capacity requirements.	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0008	Analyze and plan for anticipated changes in data capacity requirements.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
T0008	Analyze and plan for anticipated changes in data capacity requirements.	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	Control Description	AWS Config Rule	Guidance
T0008	Analyze and plan for anticipated changes in data capacity requirements.	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0008	Analyze and plan for anticipated changes in data capacity requirements.	rds-multi-az-support	Multi-AZ support in Amazon Relationa l Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availabil ity Zone. Each Availability Zone runs on its own physicall y distinct, independe nt infrastructure, and is engineered to be highly reliable. In case of an infrastru cture failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operation s as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
T0008	Analyze and plan for anticipated changes in data capacity requirements.	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
T0008	Analyze and plan for anticipated changes in data capacity requirements.	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
T0008	Analyze and plan for anticipated changes in data capacity requirements.	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0008	Analyze and plan for anticipated changes in data capacity requirements.	ec2-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	api-gw-cache-enabled-and-encrypted	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	backup-recovery-point-manual-deletion-disabled	Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	cmk-backing-key-rotation-enabled	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	ec2-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	elasticsearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	elasticsearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	elbv2-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	elb-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	kms-cmk-not-scheduled-for-deletion	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	opensearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	opensearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	rds-multi-az-support	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	s3-default-encryption-kms	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	sagemaker-endpoint-configuration-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	sagemaker-notebook-instance-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	backup-recovery-point-encrypted	Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	redshift-cluster-kms-enabled	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0017	Apply service-oriented security architecture principles to meet organization's confidentiality, integrity, and availability requirements.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.
T0024	Collect and maintain data needed to meet system cybersecurity reporting.	cw-loggroup-retention-period-check	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.

Control ID	Control Description	AWS Config Rule	Guidance
T0042	Coordinate with Cyber Defense Analysts to manage and administer the updating of rules and signatures (for example, intrusion detection/protection systems, antivirus, and content blacklists) for specialized cyber defense applications.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
T0047	Correlate incident data to identify specific vulnerabilities and make recommendations that enable expeditious remediation.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropriate levels of system availability based on critical system functions and ensure that system requirements identify appropriate disaster recovery and continuity of operations requirements to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportability requirements for system recover/restoration.	backup-recovery-point-encrypted	Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropriate levels of system availability based on critical system functions and ensure that system requirements identify appropriate disaster recovery and continuity of operations requirements to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportability requirements for system recover/restoration.	backup-recovery-point-manual-deletion-disabled	Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropria te levels of system availability based on critical system functions and ensure that system requirements identify appropria te disaster recovery and continuity of operations requireme nts to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportab ility requirements for system recover/r estoration.	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropria te levels of system availability based on critical system functions and ensure that system requirements identify appropria te disaster recovery and continuity of operations requireme nts to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportab ility requirements for system recover/r estoration.	dynamodb-autoscali ng-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/writ e capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropria te levels of system availability based on critical system functions and ensure that system requirements identify appropria te disaster recovery and continuity of operations requireme nts to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportab ility requirements for system recover/r estoration.	dynamodb-in-backup -plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropriate levels of system availability based on critical system functions and ensure that system requirements identify appropriate disaster recovery and continuity of operations requirements to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportability requirements for system recover/restoration.	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropriate levels of system availability based on critical system functions and ensure that system requirements identify appropriate disaster recovery and continuity of operations requirements to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportability requirements for system recover/restoration.	dynamodb-throughput-limit-check	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropria te levels of system availability based on critical system functions and ensure that system requirements identify appropria te disaster recovery and continuity of operations requireme nts to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportab ility requirements for system recover/r estoration.	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropria te levels of system availability based on critical system functions and ensure that system requirements identify appropria te disaster recovery and continuity of operations requireme nts to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportab ility requirements for system recover/r estoration.	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropria te levels of system availability based on critical system functions and ensure that system requirements identify appropria te disaster recovery and continuity of operations requireme nts to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportab ility requirements for system recover/r estoration.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropria te levels of system availability based on critical system functions and ensure that system requirements identify appropria te disaster recovery and continuity of operations requireme nts to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportab ility requirements for system recover/r estoration.	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropriate levels of system availability based on critical system functions and ensure that system requirements identify appropriate disaster recovery and continuity of operations requirements to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportability requirements for system recover/restoration.	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropria te levels of system availability based on critical system functions and ensure that system requirements identify appropria te disaster recovery and continuity of operations requireme nts to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportab ility requirements for system recover/r estoration.	rds-instance-delet ion-protection-ena bled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protectio n enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropria te levels of system availability based on critical system functions and ensure that system requirements identify appropria te disaster recovery and continuity of operations requireme nts to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportab ility requirements for system recover/r estoration.	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropriate levels of system availability based on critical system functions and ensure that system requirements identify appropriate disaster recovery and continuity of operations requirements to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportability requirements for system recover/restoration.	rds-multi-az-support	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropria te levels of system availability based on critical system functions and ensure that system requirements identify appropria te disaster recovery and continuity of operations requireme nts to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportab ility requirements for system recover/r estoration.	redshift-backup-en abled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropriate levels of system availability based on critical system functions and ensure that system requirements identify appropriate disaster recovery and continuity of operations requirements to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportability requirements for system recover/restoration.	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropria te levels of system availability based on critical system functions and ensure that system requirements identify appropria te disaster recovery and continuity of operations requireme nts to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportab ility requirements for system recover/r estoration.	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and applicati on failures.

Control ID	Control Description	AWS Config Rule	Guidance
T0051	Define appropria te levels of system availability based on critical system functions and ensure that system requirements identify appropria te disaster recovery and continuity of operations requireme nts to include any appropriate fail-over/alternate site requirements, backup requirements, and material supportab ility requirements for system recover/r estoration.	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilienc e requirements. It uses two tunnels to help ensure connectiv ity in case one of the Site-to-Site VPN connections becomes unavailab le. To protect against a loss of connectiv ity, in case your customer gateway becomes unavailab le, you can set up a second Site-to-S ite VPN connectio n to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
T0070	Develop Disaster Recovery and Continuity of Operations plans for systems under development and ensure testing prior to systems entering a production environment.	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
T0070	Develop Disaster Recovery and Continuity of Operations plans for systems under development and ensure testing prior to systems entering a production environment.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
T0070	Develop Disaster Recovery and Continuity of Operations plans for systems under development and ensure testing prior to systems entering a production environment.	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
T0070	Develop Disaster Recovery and Continuity of Operations plans for systems under development and ensure testing prior to systems entering a production environment.	rds-multi-az-support	Multi-AZ support in Amazon Relationa l Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availabil ity Zone. Each Availability Zone runs on its own physicall y distinct, independe nt infrastructure, and is engineered to be highly reliable. In case of an infrastru cture failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operation s as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
T0070	Develop Disaster Recovery and Continuity of Operations plans for systems under development and ensure testing prior to systems entering a production environment.	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
T0070	Develop Disaster Recovery and Continuity of Operations plans for systems under development and ensure testing prior to systems entering a production environment.	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
T0070	Develop Disaster Recovery and Continuity of Operations plans for systems under development and ensure testing prior to systems entering a production environment.	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
T0086	Ensure that the application of security patches for commercial products integrated into system design meet the timelines dictated by the managemen t authority for the intended operational environment.	rds-automatic-mino r-version-upgrade-enabled	Enable automatic minor version upgrades on your Amazon Relationa l Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed , which may include security patches and bug fixes.
T0086	Ensure that the application of security patches for commercial products integrated into system design meet the timelines dictated by the managemen t authority for the intended operational environment.	ec2-managedinstanc e-patch-compliance-status-check	Enable this rule to help with identific ation and documenta tion of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch complianc e in AWS Systems Manager as required by your organizat ion's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
T0086	Ensure that the application of security patches for commercial products integrated into system design meet the timelines dictated by the managemen t authority for the intended operational environment.	elastic-beanstalk-managed-updates-en abled	Enabling managed platform updates for an Amazon Elastic Beanstalk environme nt ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems.

Control ID	Control Description	AWS Config Rule	Guidance
T0086	Ensure that the application of security patches for commercial products integrated into system design meet the timelines dictated by the managemen t authority for the intended operational environment.	redshift-cluster-m aintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organizat ion. Specifically, that they have preferred maintenan ce windows and automated snapshot retention periods for the database. This rule requires you to set the allowVers ionUpgrade. The default is true. It also lets you optionall y set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionP eriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0110	Identify and/or determine whether a security incident is indicative of a violation of law that requires specific legal action.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
T0110	Identify and/or determine whether a security incident is indicative of a violation of law that requires specific legal action.	cloudwatch-alarm-action-check	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0110	Identify and/or determine whether a security incident is indicative of a violation of law that requires specific legal action.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
T0128	Integrate automated capabilities for updating or patching system software where practical and develop processes and procedures for manual updating and patching of system software based on current and projected patch timeline requirements for the operational environment of the system.	rds-automatic-minor-version-upgrade-enabled	Enable automatic minor version upgrades on your Amazon Relational Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes.

Control ID	Control Description	AWS Config Rule	Guidance
T0128	Integrate automated capabilities for updating or patching system software where practical and develop processes and procedures for manual updating and patching of system software based on current and projected patch timeline requirements for the operational environment of the system.	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
T0128	Integrate automated capabilities for updating or patching system software where practical and develop processes and procedures for manual updating and patching of system software based on current and projected patch timeline requirements for the operational environment of the system.	elastic-beanstalk-managed-updates-enabled	Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems.

Control ID	Control Description	AWS Config Rule	Guidance
T0128	Integrate automated capabilities for updating or patching system software where practical and develop processes and procedures for manual updating and patching of system software based on current and projected patch timeline requirements for the operational environment of the system.	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	account-part-of-organizations	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
T0144	Manage accounts, network rights, and access to systems and equipment.	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	api-gw-associated-with-waf	AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks
T0144	Manage accounts, network rights, and access to systems and equipment.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associate d resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessibl e, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.
T0144	Manage accounts, network rights, and access to systems and equipment.	ecs-task-definition-user-for-host-mode-check	If a task definition has elevated privilege s it is because the customer has specifically opted-in to those configura tions. This control checks for unexpecte d privilege escalation when a task definitio n has host networkin g enabled but the customer has not opted-in to elevated privileges.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management.
T0144	Manage accounts, network rights, and access to systems and equipment.	iam-policy-no-stat ements-with-full-a ccess	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
T0144	Manage accounts, network rights, and access to systems and equipment.	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
T0144	Manage accounts, network rights, and access to systems and equipment.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	access-keys-rotated	The credentials are audited for authorize d devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromis ed. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
T0144	Manage accounts, network rights, and access to systems and equipment.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	emr-kerberos-enabled	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
T0144	Manage accounts, network rights, and access to systems and equipment.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	iam-customer-policy-blocked-kms-actions	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEnc ryptFrom). The actual values should reflect your organization's policies

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	iam-group-has-users-check	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissio ns or job function is one way to incorpora te least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	iam-inline-policy-blocked-kms-actions	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Managemen t Service keys. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegatin g permissions management. This rule allows you to set the blockedAc tionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
T0144	Manage accounts, network rights, and access to systems and equipment.	iam-user-group-membership-check	AWS Identity and Access Managemen t (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users.
T0144	Manage accounts, network rights, and access to systems and equipment.	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
T0144	Manage accounts, network rights, and access to systems and equipment.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
T0144	Manage accounts, network rights, and access to systems and equipment.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
T0144	Manage accounts, network rights, and access to systems and equipment.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
T0144	Manage accounts, network rights, and access to systems and equipment.	secretsmanager-rotation-enabled-check	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potential ly reduce the business impact if the secret is compromised.

Control ID	Control Description	AWS Config Rule	Guidance
T0144	Manage accounts, network rights, and access to systems and equipment.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
T0151	Monitor and evaluate the effectiveness of the enterpris e's cybersecurity safeguards to ensure that they provide the intended level of protection.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
T0151	Monitor and evaluate the effectiveness of the enterpris e's cybersecurity safeguards to ensure that they provide the intended level of protection.	cloudwatch-alarm-a ction-check	Amazon CloudWatc h alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequire d (Config Default: True), insuffici entDataActionRequi red (Config Default: True), okActionR equired (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0151	Monitor and evaluate the effectiveness of the enterpris e's cybersecurity safeguards to ensure that they provide the intended level of protection.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.
T0152	Monitor and maintain databases to ensure optimal performance.	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
T0152	Monitor and maintain databases to ensure optimal performance.	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	dynamodb-throughput-limit-check	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	rds-automatic-minor-version-upgrade-enabled	Enable automatic minor version upgrades on your Amazon Relational Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	rds-enhanced-monitoring-enabled	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
T0152	Monitor and maintain databases to ensure optimal performance.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	rds-multi-az-support	Multi-AZ support in Amazon Relationa l Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availabil ity Zone. Each Availability Zone runs on its own physicall y distinct, independe nt infrastructure, and is engineered to be highly reliable. In case of an infrastru cture failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operation s as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
T0152	Monitor and maintain databases to ensure optimal performance.	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
T0152	Monitor and maintain databases to ensure optimal performance.	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
T0152	Monitor and maintain databases to ensure optimal performance.	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.

Control ID	Control Description	AWS Config Rule	Guidance
T0152	Monitor and maintain databases to ensure optimal performance.	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryptio n to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
T0152	Monitor and maintain databases to ensure optimal performance.	redshift-cluster-kms-enabled	To help protect data at rest, ensure encryption with AWS Key Managemen t Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0153	Monitor network capacity and performance.	autoscaling-group-elb-healthcheck-required	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	Control Description	AWS Config Rule	Guidance
T0153	Monitor network capacity and performance.	dynamodb-throughput-limit-check	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0153	Monitor network capacity and performance.	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
T0153	Monitor network capacity and performance.	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	cw-loggroup-retention-period-check	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
T0154	Monitor and report the usage of knowledge management assets and resources.	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	lambda-concurrency-check	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
T0154	Monitor and report the usage of knowledge management assets and resources.	lambda-dlq-check	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	rds-enhanced-monitoring-enabled	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	wafv2-logging-enabled	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
T0154	Monitor and report the usage of knowledge management assets and resources.	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	autoscaling-group-elb-healthcheck-required	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	beanstalk-enhanced-health-reporting-enabled	AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate.
T0154	Monitor and report the usage of knowledge management assets and resources.	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	cloudtrail-enabled	AWS CloudTrail can help in non-repud iation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated , and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
T0154	Monitor and report the usage of knowledge management assets and resources.	cloudtrail-s3-data events-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	cloudwatch-alarm-action-check	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	dynamodb-throughput-limit-check	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	ec2-instance-detailed-monitoring-enabled	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
T0154	Monitor and report the usage of knowledge management assets and resources.	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
T0154	Monitor and report the usage of knowledge management assets and resources.	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
T0156	Oversee and make recommendations regarding configuration management.	account-part-of-organizations	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.

Control ID	Control Description	AWS Config Rule	Guidance
T0156	Oversee and make recommendations regarding configuration management.	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0156	Oversee and make recommendations regarding configuration management.	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0156	Oversee and make recommendations regarding configuration management.	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
T0156	Oversee and make recommendations regarding configuration management.	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0156	Oversee and make recommendations regarding configuration management.	elastic-beanstalk-managed-updates-enabled	Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems.

Control ID	Control Description	AWS Config Rule	Guidance
T0156	Oversee and make recommendations regarding configura tion management.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0156	Oversee and make recommendations regarding configura tion management.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0156	Oversee and make recommendations regarding configura tion management.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
T0160	Patch network vulnerabilities to ensure that informati on is safeguarded against outside parties.	rds-automatic-mino r-version-upgrade-enabled	Enable automatic minor version upgrades on your Amazon Relationa l Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed , which may include security patches and bug fixes.

Control ID	Control Description	AWS Config Rule	Guidance
T0160	Patch network vulnerabilities to ensure that informati on is safeguarded against outside parties.	ec2-managedinstanc e-association-comp liance-status-check	Use AWS Systems Manager Associati ons to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configura tion state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configura tions, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0160	Patch network vulnerabilities to ensure that informati on is safeguarded against outside parties.	ec2-managedinstanc e-patch-compliance-status-check	Enable this rule to help with identific ation and documenta tion of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch complianc e in AWS Systems Manager as required by your organizat ion's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
T0162	Perform backup and recovery of databases to ensure data integrity.	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0162	Perform backup and recovery of databases to ensure data integrity.	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0162	Perform backup and recovery of databases to ensure data integrity.	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0162	Perform backup and recovery of databases to ensure data integrity.	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0162	Perform backup and recovery of databases to ensure data integrity.	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
T0162	Perform backup and recovery of databases to ensure data integrity.	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0162	Perform backup and recovery of databases to ensure data integrity.	backup-recovery-point-encrypted	Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
T0162	Perform backup and recovery of databases to ensure data integrity.	backup-recovery-point-manual-deletion-disabled	Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion.

Control ID	Control Description	AWS Config Rule	Guidance
T0162	Perform backup and recovery of databases to ensure data integrity.	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.
T0162	Perform backup and recovery of databases to ensure data integrity.	dynamodb-pitr-enabled	Enable this rule to check that informati on has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
T0162	Perform backup and recovery of databases to ensure data integrity.	ec2-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
T0162	Perform backup and recovery of databases to ensure data integrity.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
T0162	Perform backup and recovery of databases to ensure data integrity.	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0162	Perform backup and recovery of databases to ensure data integrity.	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
T0162	Perform backup and recovery of databases to ensure data integrity.	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	cw-loggroup-retention-period-check	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	wafv2-logging-enabled	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	cloudtrail-enabled	AWS CloudTrail can help in non-repud iation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated , and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	cloudtrail-s3-data events-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environme nt. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains informati on such as the time the request was received, the client's IP address, latencies , request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
T0166	Perform event correlation using information gathered from a variety of sources within the enterprise to gain situational awareness and determine the effectiveness of an observed attack.	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
T0168	Perform hash comparison against established database.	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	api-gw-associated-with-waf	AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	autoscaling-launch -config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associate d resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessibl e, as this may allow unintended access to your applications or servers.
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requirements.	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requirements.	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requirements.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requirements.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requirements.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	ec2-instance-no-pu blic-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearc h Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requirements.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requirements.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requirements.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requirements.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requirements.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requirements.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requirements.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0195	Provide a managed flow of relevant information (via web-based portals or other means) based on mission requireme nts.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
T0215	Recognize a possible security violation and take appropriate action to report the incident, as required.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0244	Verify that applicati on software/ network/system security postures are implemented as stated, document deviations, and recommend required actions to correct those deviations.	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrai l log file validation to check the integrity of CloudTrail logs. Log file validatio n helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithm s: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
T0244	Verify that application software/network/system security postures are implemented as stated, document deviations, and recommend required actions to correct those deviations.	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0244	Verify that application software/network/system security postures are implemented as stated, document deviations, and recommend required actions to correct those deviations.	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0258	Provide timely detection, identification, and alerting of possible attacks/intrusions, anomalous activities, and misuse activities and distinguish these incidents and events from benign activities.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
T0259	Use cyber defense tools for continual monitoring and analysis of system activity to identify malicious activity.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0262	Employ approved defense-in-depth principles and practices (for example, defense-in-multiple places, layered defenses, security robustness).	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
T0262	Employ approved defense-in-depth principles and practices (for example, defense-in-multiple places, layered defenses, security robustness).	api-gw-associated-with-waf	AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks

Control ID	Control Description	AWS Config Rule	Guidance

Control ID	Control Description	AWS Config Rule	Guidance
T0262	Employ approved defense-in-depth principles and practices (for example, defense-in-multiple places, layered defenses, security robustness).	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0262	Employ approved defense-in-depth principles and practices (for example, defense-in-multiple places, layered defenses, security robustness).	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	account-part-of-organizations	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
T0284	Design and develop new tools/technologies as related to cybersecurity.	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	api-gw-associated-with-waf	AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associate d resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessibl e, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	ecs-task-definition-user-for-host-mode-check	If a task definition has elevated privilege s it is because the customer has specifically opted-in to those configura tions. This control checks for unexpecte d privilege escalation when a task definitio n has host networkin g enabled but the customer has not opted-in to elevated privileges.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management.
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	iam-policy-no-stat ements-with-full-a ccess	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	no-unrestricted-ro ute-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	rds-automatic-mino r-version-upgrade- enabled	Enable automatic minor version upgrades on your Amazon Relationa l Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed , which may include security patches and bug fixes.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	backup-recovery-point-manual-deletion-disabled	Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventin g accidental or intentional deletion.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	codebuild-project-envvar-awscred-check	Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
T0284	Design and develop new tools/technologies as related to cybersecurity.	codebuild-project-source-repo-url-check	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, sign-in credentials within AWS Codebuild project environments. Use OAuth instead of personal access tokens or sign-in credentials to grant authorization for accessing GitHub or Bitbucket repositories.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearc h Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	emr-kerberos-enabled	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
T0284	Design and develop new tools/technologies as related to cybersecurity.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	iam-customer-policy-blocked-kms-actions	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEnc ryptFrom). The actual values should reflect your organization's policies

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	iam-group-has-users-check	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissio ns or job function is one way to incorpora te least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	iam-inline-policy-blocked-kms-actions	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Managemen t Service keys. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegatin g permissions management. This rule allows you to set the blockedAc tionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa

Control ID	Control Description	AWS Config Rule	Guidance
			sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	iam-user-group-mem bership-check	AWS Identity and Access Managemen t (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	iam-user-mfa-enabl ed	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-fac tor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users.
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	iam-user-no-policies-check	This rule ensures AWS Identity and Access Managemen t (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportuni ty for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communica tion between a function and other services within the Amazon VPC. With this configuration, there is no requireme nt for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	redshift-cluster-p ublic-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	root-account-mfa-e nabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	s3-bucket-public-r ead-prohibited	Manage access to resources in the AWS Cloud by only allowing authorize d users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/technologies as related to cybersecurity.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
T0284	Design and develop new tools/technologies as related to cybersecurity.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0284	Design and develop new tools/tec hnologies as related to cybersecurity.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
T0306	Supports incident managemen t, service-level management, change management, release managemen t, continuity management, and availability management for databases and data management systems.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
T0306	Supports incident managemen t, service-level management, change management, release managemen t, continuity management, and availability management for databases and data management systems.	cloudwatch-alarm-a ction-check	Amazon CloudWatc h alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequire d (Config Default: True), insuffici entDataActionRequi red (Config Default: True), okActionR equired (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0306	Supports incident managemen t, service-level management, change management, release managemen t, continuity management, and availability management for databases and data management systems.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0314	Develop a system security context, a preliminary system security Concept of Operations (CONOPS), and define baseline system security requirements in accordance with applicable cybersecurity requirements.	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0314	Develop a system security context, a preliminary system security Concept of Operations (CONOPS), and define baseline system security requirements in accordance with applicable cybersecurity requirements.	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0314	Develop a system security context, a preliminary system security Concept of Operations (CONOPS), and define baseline system security requirements in accordance with applicable cybersecurity requirements.	ec2-stopped-instance	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
T0314	Develop a system security context, a preliminary system security Concept of Operations (CONOPS), and define baseline system security requirements in accordance with applicable cybersecurity requirements.	ec2-volume-inuse-check	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
T0314	Develop a system security context, a preliminary system security Concept of Operations (CONOPS), and define baseline system security requirements in accordance with applicable cybersecurity requirements.	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
T0314	Develop a system security context, a preliminary system security Concept of Operations (CONOPS), and define baseline system security requirements in accordance with applicable cybersecu rity requirements.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	multi-region-cloud trail-enabled	AWS CloudTrai l records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REG ION_CLOUD _TRAIL_ENABLED is enabled. Additiona lly, when AWS launches a new Region, CloudTrai l will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	cloudtrail-enabled	AWS CloudTrail can help in non-repud iation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated , and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	cloudtrail-s3-data events-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	emr-kerberos-enabl ed	The access permissio ns and authoriza tions can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	iam-customer-policy-blocked-kms-actions	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEnc ryptFrom). The actual values should reflect your organization's policies

Control ID	Control Description	AWS Config Rule	Guidance
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	iam-group-has-users-check	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissio ns or job function is one way to incorpora te least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	iam-inline-policy-blocked-kms-actions	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Managemen t Service keys. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegatin g permissions management. This rule allows you to set the blockedAc tionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	iam-policy-no-stat ements-with-admin-access	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	iam-user-group-mem bership-check	AWS Identity and Access Managemen t (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	iam-user-no-policies-check	This rule ensures AWS Identity and Access Managemen t (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportuni ty for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
T0376	Establish, resource, implement , and assess cyber workforce managemen t programs in accordance with organizational requirements.	vpc-flow-logs-enab led	The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interface s in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
T0416	Enable applications with public keying by leveraging existing public key infrastructure (PKI) libraries and incorporating certificate management and encryption functionalities when appropriate.	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
T0416	Enable applications with public keying by leveraging existing public key infrastructure (PKI) libraries and incorporating certificate management and encryption functionalities when appropriate.	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0416	Enable applications with public keying by leveraging existing public key infrastru cture (PKI) libraries and incorpora ting certificate management and encryption functiona lities when appropria te.	elasticsearch-node-to-node-encryption-check	Ensure node-to-node encryptio n for Amazon OpenSearch Service is enabled. Node-to-node encryptio n enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
T0416	Enable applications with public keying by leveraging existing public key infrastru cture (PKI) libraries and incorpora ting certificate management and encryption functiona lities when appropria te.	elbv2-acm-certific ate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0416	Enable applications with public keying by leveraging existing public key infrastructure (PKI) libraries and incorporating certificate management and encryption functionalities when appropriate.	elb-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
T0416	Enable applications with public keying by leveraging existing public key infrastructure (PKI) libraries and incorporating certificate management and encryption functionalities when appropriate.	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0416	Enable applications with public keying by leveraging existing public key infrastructure (PKI) libraries and incorporating certificate management and encryption functionalities when appropriate.	opensearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
T0416	Enable applications with public keying by leveraging existing public key infrastructure (PKI) libraries and incorporating certificate management and encryption functionalities when appropriate.	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0416	Enable applications with public keying by leveraging existing public key infrastructure (PKI) libraries and incorporating certificate management and encryption functionalities when appropriate.	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
T0416	Enable applications with public keying by leveraging existing public key infrastructure (PKI) libraries and incorporating certificate management and encryption functionalities when appropriate.	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway.

Control ID	Control Description	AWS Config Rule	Guidance
T0421	Manage the indexing/cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.
T0421	Manage the indexing/cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0421	Manage the indexing/ cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
T0421	Manage the indexing/ cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0421	Manage the indexing/cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
T0421	Manage the indexing/cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0421	Manage the indexing/cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
T0421	Manage the indexing/cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0421	Manage the indexing/cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0421	Manage the indexing/cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0421	Manage the indexing/cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
T0421	Manage the indexing/cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
T0421	Manage the indexing/cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
T0421	Manage the indexing/cataloguing, storage, and access of explicit organizational knowledge (for example, hard copy documents, digital files).	emr-kerberos-enabled	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	iam-user-group-mem bership-check	AWS Identity and Access Managemen t (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	iam-user-no-policies-check	This rule ensures AWS Identity and Access Managemen t (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportuni ty for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
T0475	Assess adequate access controls based on principles of least privilege and need-to-know.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
T0489	Implement system security measures in accordance with established procedures to ensure confidentiality, integrity, availability, authentication, and non-repudiation.	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
T0489	Implement system security measures in accordance with established procedures to ensure confidentiality, integrity, availability, authentication, and non-repudiation.	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
T0489	Implement system security measures in accordance with established procedures to ensure confidentiality, integrity, availability, authentication, and non-repudiation.	wafv2-logging-enabled	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
T0489	Implement system security measures in accordance with established procedures to ensure confidentiality, integrity, availability, authentication, and non-repudiation.	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
T0489	Implement system security measures in accordance with established procedures to ensure confidentiality, integrity, availability, authentication, and non-repudiation.	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
T0489	Implement system security measures in accordance with established procedures to ensure confidentiality, integrity, availability, authentication, and non-repudiation.	cloudtrail-enabled	AWS CloudTrail can help in non-repud iation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated , and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
T0489	Implement system security measures in accordance with established procedures to ensure confidentiality, integrity, availability, authentication, and non-repudiation.	cloudtrail-s3-data events-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
T0489	Implement system security measures in accordance with established procedures to ensure confidentiality, integrity, availability, authentication, and non-repudiation.	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environme nt. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains informati on such as the time the request was received, the client's IP address, latencies , request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
T0489	Implement system security measures in accordance with established procedures to ensure confidentiality, integrity, availability, authentication, and non-repudiation.	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
T0489	Implement system security measures in accordance with established procedures to ensure confidentiality, integrity, availability, authentication, and non-repudiation.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0489	Implement system security measures in accordance with established procedures to ensure confidentiality, integrity, availability, authentication, and non-repudiation.	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
T0489	Implement system security measures in accordance with established procedures to ensure confidentiality, integrity, availability, authentication, and non-repudiation.	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
T0491	Install and configure hardware, software, and periphera l equipment for system users in accordance with organizational standards.	ec2-instance-manag ed-by-systems-mana ger	An inventory of the software platforms and applications within the organizat ion is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installat ions, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0491	Install and configure hardware, software, and periphera l equipment for system users in accordance with organizational standards.	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0491	Install and configure hardware, software, and periphera l equipment for system users in accordance with organizational standards.	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identific ation and documenta tion of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch complianc e in AWS Systems Manager as required by your organizat ion's policies and procedures.
T0503	Monitor external data sources (for example, cyber defense vendor sites, Computer Emergency Response Teams, Security Focus) to maintain currency of cyber defense threat condition and determine which security issues may have an impact on the enterprise.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0509	Perform an informati on security risk assessment.	annual-risk-assess ment-performed (process check)	Perform an annual risk assessment on your organization. Risk assessments can assist in determini ng the likelihood and impact of identified risks and/or vulnerabi lities affecting an organization.
T0553	Apply cybersecu rity functions (for example, encryptio n, access control, and identity managemen t) to reduce exploitat ion opportunities.	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	elasticsearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	iam-customer-policy-blocked-kms-actions	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	iam-group-has-users-check	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	iam-inline-policy-blocked-kms-actions	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPa

Control ID	Control Description	AWS Config Rule	Guidance
			sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	iam-user-group-membership-check	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	opensearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	opensearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	s3-default-encryption-kms	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	sagemaker-notebook-instance-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	api-gw-cache-enabled-and-encrypted	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	elasticsearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	elb-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	redshift-cluster-kms-enabled	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
T0553	Apply cybersecurity functions (for example, encryption, access control, and identity management) to reduce exploitation opportunities.	sagemaker-endpoint-configuration-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
T0557	Integrate key management functions as related to cyberspace.	cmk-backing-key-rotation-enabled	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.

Control ID	Control Description	AWS Config Rule	Guidance
T0557	Integrate key management functions as related to cyberspace.	kms-cmk-not-scheduled-for-deletion	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
T0576	Assess all-source intelligence and recommend targets to support cyber operation objectives.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
T0609	Conduct access enabling of wireless computer and digital networks.	api-gw-associated-with-waf	AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.
T0609	Conduct access enabling of wireless computer and digital networks.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
T0609	Conduct access enabling of wireless computer and digital networks.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
T0609	Conduct access enabling of wireless computer and digital networks.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
T0609	Conduct access enabling of wireless computer and digital networks.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
T0609	Conduct access enabling of wireless computer and digital networks.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
T0609	Conduct access enabling of wireless computer and digital networks.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
T0609	Conduct access enabling of wireless computer and digital networks.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
T0609	Conduct access enabling of wireless computer and digital networks.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.
T0616	Conduct network scouting and vulnerability analyses of systems within a network.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0686	Identify threat vulnerabilities.	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
T0686	Identify threat vulnerabilities.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather information about networks through traditional and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	cw-loggroup-retention-period-check	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
T0706	Gather information about networks through traditional and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	elasticsearch-logs-to-cloudwatch	Ensure Amazon Elasticsearch service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	lambda-concurrency-check	This rule ensures that a Lambda function' s concurrency high and low limits are established. This can assist in baselinin g the number of requests that your function is serving at any given time.
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	lambda-dlq-check	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather information about networks through traditional and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather information about networks through traditional and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	rds-enhanced-monitoring-enabled	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	wafv2-logging-enab led	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	api-gw-execution-l ogging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	autoscaling-group-elb-healthcheck-required	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	beanstalk-enhanced -health-reporting- enabled	AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastru cture. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate.
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	cloud-trail-cloud- watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	cloudtrail-enabled	AWS CloudTrail can help in non-repud iation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated , and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	cloudtrail-s3-data events-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather information about networks through traditional and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	cloudwatch-alarm-action-check	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	dynamodb-throughput-limit-check	Enable this rule to ensure that provision ed throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughpu t requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionall y set accountRC UThresholdPercenta ge (Config Default: 80) and accountWC UThresholdPercenta ge (Config Default: 80) parameters. The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather information about networks through traditional and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	ec2-instance-detailed-monitoring-enabled	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
T0706	Gather information about networks through traditional and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	redshift-cluster-c onfiguration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configura tions are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather informati on about networks through tradition al and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
T0706	Gather information about networks through traditional and alternative techniques, (for example, social network analysis, call-chaining, traffic analysis.)	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
T0777	Profile network or system administrators and their activities.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0805	Report intelligence-derived significant network events and intrusions.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.
T0877	Work cooperati vely with applicable organization units in overseeing consumer information access rights	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
T0877	Work cooperatively with applicable organization units in overseeing consumer information access rights	ecs-task-definition-user-for-host-mode-check	If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges.
T0877	Work cooperatively with applicable organization units in overseeing consumer information access rights	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
T0877	Work cooperatively with applicable organization units in overseeing consumer information access rights	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
T0877	Work cooperatively with applicable organization units in overseeing consumer information access rights	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
T0877	Work cooperati vely with applicable organization units in overseeing consumer information access rights	emr-kerberos-enabl ed	The access permissio ns and authoriza tions can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
T0877	Work cooperatively with applicable organization units in overseeing consumer information access rights	iam-group-has-users-check	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
T0877	Work cooperatively with applicable organization units in overseeing consumer information access rights	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0877	Work cooperatively with applicable organization units in overseeing consumer information access rights	iam-user-group-membership-check	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
T0877	Work cooperatively with applicable organization units in overseeing consumer information access rights	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
T0877	Work cooperati vely with applicable organization units in overseeing consumer information access rights	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0935	Perform an informati on security risk assessment.	annual-risk-assess ment-performed (process check)	Perform an annual risk assessment on your organization. Risk assessments can assist in determini ng the likelihood and impact of identified risks and/or vulnerabi lities affecting an organization.
T0960	Monitor changes to a system and its environment of operation.	lambda-concurrency-check	This rule ensures that a Lambda function' s concurrency high and low limits are established. This can assist in baselinin g the number of requests that your function is serving at any given time.
T0960	Monitor changes to a system and its environment of operation.	lambda-dlq-check	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	Control Description	AWS Config Rule	Guidance
T0960	Monitor changes to a system and its environment of operation.	rds-enhanced-monitoring-enabled	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
T0960	Monitor changes to a system and its environment of operation.	autoscaling-group-elb-healthcheck-required	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	Control Description	AWS Config Rule	Guidance
T0960	Monitor changes to a system and its environment of operation.	beanstalk-enhanced-health-reporting-enabled	AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate.

Control ID	Control Description	AWS Config Rule	Guidance
T0960	Monitor changes to a system and its environment of operation.	cloudwatch-alarm-action-check	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
T0960	Monitor changes to a system and its environment of operation.	dynamodb-throughput-limit-check	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0960	Monitor changes to a system and its environment of operation.	ec2-instance-detailed-monitoring-enabled	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	ecs-task-definition-user-for-host-mode-check	If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges.
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	access-keys-rotated	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	emr-kerberos-enabled	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. Control ID	Control Description	AWS Config Rule	Guidance
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	iam-user-group-membership-check	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users.
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	root-account-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
T0992	Determine how the continuous monitoring results will be used in ongoing authorization.	secretsmanager-rotation-enabled-check	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.

Control ID	Control Description	AWS Config Rule	Guidance
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	iam-customer-policy-blocked-kms-actions	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEnc ryptFrom). The actual values should reflect your organization's policies

Control ID	Control Description	AWS Config Rule	Guidance
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	iam-group-has-users-check	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissio ns or job function is one way to incorpora te least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	iam-inline-policy-blocked-kms-actions	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Managemen t Service keys. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegatin g permissions management. This rule allows you to set the blockedAc tionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management.

Control ID	Control Description	AWS Config Rule	Guidance
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa

Control ID	Control Description	AWS Config Rule	Guidance
			sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	iam-user-group-membership-check	AWS Identity and Access Managemen t (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	iam-user-no-policies-check	This rule ensures AWS Identity and Access Managemen t (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportuni ty for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users.
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
T0993	Establish continuous monitoring tools and technologies access control process and procedures.	root-account-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Template

The template is available on GitHub: Operational Best Practices for NIST 800 181.

Operational Best Practices for NIST 1800 25

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between NIST 1800-25 and AWS managed Config rules. Each AWS Config applies to a specific AWS resource,and relates to one or more NIST 1800-25 controls. A NIST 1800-25 control can be related to multiple AWS Config rules. Refer to the table below for more detail and guidance related to these mappings.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-2	Software platforms and applications within the organizat ion are inventoried	ec2-instance-manag ed-by-systems-mana ger	An inventory of the software platforms and applications within the organizat ion is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installat ions, application name, publisher and version, and other details about your environment.
ID.AM-2	Software platforms and applications within the organizat ion are inventoried	ec2-managedinstanc e-association-comp liance-status-check	Use AWS Systems Manager Associati ons to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configura tion state to your

Control ID	Control Description	AWS Config Rule	Guidance
			managed instances and allows you to set baselines of operating system patch levels, software installations, application configura tions, and other details about your environment.
ID.AM-2	Software platforms and applications within the organizat ion are inventoried	ec2-stopped-instance	Enable this rule to help with the baseline configura tion of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-2	Software platforms and applications within the organizat ion are inventoried	eip-attached	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
ID.AM-2	Software platforms and applications within the organizat ion are inventoried	vpc-network-acl-un used-check	This rule ensures that Amazon Virtual Private Cloud (VPC) network access control lists are in use. Monitoring for unused network access control lists can assist in accurate inventory and management of your environment.

Control ID	Control Description	AWS Config Rule	Guidance
ID.RA-1	Asset vulnerabilities are identified and documented	rds-automatic-minor-version-upgrade-enabled	Enable automatic minor version upgrades on your Amazon Relational Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes.
ID.RA-1	Asset vulnerabilities are identified and documented	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
ID.RA-1	Asset vulnerabilities are identified and documented	elastic-beanstalk-managed-updates-enabled	Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems.
ID.RA-1	Asset vulnerabilities are identified and documented	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	ecs-task-definition-user-for-host-mode-check	If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	access-keys-rotated	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	emr-kerberos-enabled	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-group-has-users-check	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorize d devices, users and processes	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	secretsmanager-rotation-enabled-check	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
PR.AC-3	Remote access is managed.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
PR.AC-3	Remote access is managed.	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
PR.AC-3	Remote access is managed.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
PR.AC-3	Remote access is managed.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
PR.AC-3	Remote access is managed.	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.AC-3	Remote access is managed.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	s3-bucket-level-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level.
PR.AC-3	Remote access is managed.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.AC-3	Remote access is managed.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	autoscaling-launch -config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associate d resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessibl e, as this may allow unintended access to your applications or servers.
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	ec2-imdsv2-check	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-b ased controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	ecs-task-definition-user-for-host-mode-check	If a task definition has elevated privilege s it is because the customer has specifically opted-in to those configura tions. This control checks for unexpecte d privilege escalation when a task definitio n has host networkin g enabled but the customer has not opted-in to elevated privileges.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management.
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	iam-policy-no-stat ements-with-full-a ccess	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	ssm-document-not-p ublic	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	ec2-instance-no-pu blic-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearc h Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	emr-kerberos-enabl ed	The access permissio ns and authoriza tions can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	iam-group-has-users-check	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	iam-policy-no-stat ements-with-admin-access	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	iam-user-no-policies-check	This rule ensures AWS Identity and Access Managemen t (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportuni ty for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	iam-user-unused-cr edentials-check	AWS Identity and Access Managemen t (IAM) can help you with access permissio ns and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentia ls, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsage Age (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	lambda-function-pu blic-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potential ly lead to degradati on of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearc h Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	redshift-cluster-p ublic-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	s3-bucket-level-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associate d resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessibl e, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	s3-default-encryption-kms	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	sagemaker-notebook-instance-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	sns-encrypted-kms	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	api-gw-cache-enabled-and-encrypted	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
PR.DS-1	Data-at-rest is protected	elasticsearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains.
PR.DS-1	Data-at-rest is protected	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	kms-cmk-not-scheduled-for-deletion	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
PR.DS-1	Data-at-rest is protected	opensearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	redshift-cluster-kms-enabled	To help protect data at rest, ensure encryption with AWS Key Managemen t Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	sagemaker-endpoint-configuration-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	secretsmanager-using-cmk	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-2	Data-in-transit is protected	elasticsearch-node-to-node-encryption-check	Ensure node-to-node encryptio n for Amazon OpenSearch Service is enabled. Node-to-node encryptio n enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
PR.DS-2	Data-in-transit is protected	elbv2-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-2	Data-in-transit is protected	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.
PR.DS-2	Data-in-transit is protected	opensearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-2	Data-in-transit is protected	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
PR.DS-2	Data-in-transit is protected	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-2	Data-in-transit is protected	elb-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
PR.DS-2	Data-in-transit is protected	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryptio n to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-2	Data-in-transit is protected	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-6	Integrity checking mechanisms are used to verify software, firmware, and information integrity	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-6	Integrity checking mechanisms are used to verify software, firmware, and information integrity	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and applicati on failures.
PR.IP-1	A baseline configura tion of informati on technology/ industrial control systems is created and maintaine d incorporating security principles (for example concept of least functionality)	account-part-of-or ganizations	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsist ent account configura tions, which may expose resources and sensitive data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (for example concept of least functionality)	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (for example concept of least functionality)	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (for example concept of least functionality)	ec2-stopped-instance	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (for example concept of least functionality)	ec2-volume-inuse-check	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (for example concept of least functionality)	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-3	Configuration change control processes are in place	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
PR.IP-3	Configuration change control processes are in place	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	dynamodb-in-backup -plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	redshift-backup-en abled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.
PR.IP-4	Backups of informati on are conducted , maintained, and tested	dynamodb-pitr-enab led	Enable this rule to check that informati on has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	redshift-cluster-m aintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organizat ion. Specifically, that they have preferred maintenan ce windows and automated snapshot retention periods for the database. This rule requires you to set the allowVers ionUpgrade. The default is true. It also lets you optionall y set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionP eriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	s3-bucket-replicat ion-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replicati on (CRR) supports maintaining adequate capacity and availabil ity. CRR enables automatic, asynchron ous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
PR.IP-4	Backups of informati on are conducted , maintained, and tested	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and applicati on failures.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-9	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are in place and managed.	response-plan-exists-maintained (Process Check)	Ensure incident response plans are established, maintained, and distributed to responsible personnel . Having updated and formally documente d response plans can assist in making sure response personnel understand roles, responsibilities and processes to be followed during an incident.
PR.IP-10	Response and recovery plans are tested.	response-plan-tested (Process Check)	Ensure Incident response and recovery plans are tested. This can assist in understanding if your plan will be effective during an incident and if any gaps or updates need to be addressed.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-12	A vulnerability management plan is developed and implemented.	vuln-management-plan-exists (Process Check)	Ensure a vulnerability management plan is developed and implemented in order to have a formally defined processes to address vulnerabilities in your environment. This can include vulnerability management tools, environmental scanning cadence, roles and responsibilities.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-12	A vulnerability management plan is developed and implemented	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-12	A vulnerability management plan is developed and implemented	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-12	A vulnerability management plan is developed and implemented	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
PR.MA-2	Remote maintenance of organizational assets is approved, logged, and performed in a manner that prevents unauthorized access	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
PR.MA-2	Remote maintenance of organizational assets is approved, logged, and performed in a manner that prevents unauthorized access	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Communications and control networks are protected	opensearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	rds-enhanced-monitoring-enabled	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	wafv2-logging-enab led	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	api-gw-execution-l ogging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	cloudtrail-enabled	AWS CloudTrail can help in non-repud iation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated , and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	cloudtrail-s3-data events-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environme nt. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains informati on such as the time the request was received, the client's IP address, latencies , request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	iam-user-no-policies-check	This rule ensures AWS Identity and Access Managemen t (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportuni ty for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	s3-bucket-level-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.
PR.PT-4	Communications and control networks are protected	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associate d resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessibl e, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
PR.PT-4	Communications and control networks are protected	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
PR.PT-4	Communications and control networks are protected	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
PR.PT-4	Communications and control networks are protected	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
PR.PT-4	Communications and control networks are protected	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.PT-4	Communications and control networks are protected	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.PT-4	Communications and control networks are protected	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.PT-4	Communications and control networks are protected	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
DE.CM-8	Vulnerability scans are performed.	vuln-scans-performed (Process Check)	Ensure vulnerability scans are performed according to your compliance requirements. The cadence of scanning, tools used, and use of results should be defined by your organization.

Control ID	Control Description	AWS Config Rule	Guidance
RS.MI-3	Newly identified vulnerabilities are mitigated or documented as accepted risks.	vuln-mitigated-accepted (Process Check)	Ensure newly identified vulnerabilities are remediated or documented as accepted risks. Services such as AWS Security Hub, Amazon Guard Duty, Amazon Inspector, and AWS Config can assist in identifying vulnerabilities within your environment. Vulnerabilities should be remediated or accepted as risks according to your organizations compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
RS.MI-3	Newly identified vulnerabilities are mitigated or documented as accepted risks	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Template

The template is available on GitHub: Operational Best Practices for NIST 1800 25.

Operational Best Practices for NIST CSF

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard.

You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the NIST Cyber Security Framework (CSF) and AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more NIST CSF controls. A NIST CSF control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS

Control ID	Control Description	AWS Config Rule	Guidance
			Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	opensearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	wafv2-logging-enabled	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	cloudtrail-s3-data events-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environme nt. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains informati on such as the time the request was received, the client's IP address, latencies , request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-2	Detected events are analyzed to understand attack targets and methods	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-2	Detected events are analyzed to understand attack targets and methods	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	opensearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	wafv2-logging-enabled	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	cloudtrail-enabled	AWS CloudTrail can help in non-repud iation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated , and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	cloudtrail-s3-data events-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environme nt. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
DE.AE-4	Impact of events is determined	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-4	Impact of events is determined	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-4	Impact of events is determined	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
DE.AE-4	Impact of events is determined	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-4	Impact of events is determined	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-4	Impact of events is determined	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-4	Impact of events is determined	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-4	Impact of events is determined	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
DE.CM-1	The network is monitored to detect potential cybersecurity events	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-1	The network is monitored to detect potential cybersecurity events	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
DE.CM-1	The network is monitored to detect potential cybersecurity events	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. DE.CM-3	Personnel activity is monitored to detect potential cybersecu rity events	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-4	Malicious code is detected	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-4	Malicious code is detected	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.
DE.CM-5	Unauthorized mobile code is detected	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-5	Unauthorized mobile code is detected	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
DE.CM-5	Unauthorized mobile code is detected	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-5	Unauthorized mobile code is detected	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-5	Unauthorized mobile code is detected	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-5	Unauthorized mobile code is detected	wafv2-logging-enabled	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-6	External service provider activity is monitored to detect potential cybersecurity events	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
DE.CM-6	External service provider activity is monitored to detect potential cybersecurity events	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-6	External service provider activity is monitored to detect potential cybersecu rity events	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-6	External service provider activity is monitored to detect potential cybersecurity events	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-6	External service provider activity is monitored to detect potential cybersecu rity events	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-6	External service provider activity is monitored to detect potential cybersecurity events	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
DE.CM-7	Monitoring for unauthorized personnel, connections, devices, and software is performed	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-7	Monitoring for unauthorized personnel, connections, devices, and software is performed	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
DE.CM-7	Monitoring for unauthorized personnel, connections, devices, and software is performed	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-7	Monitoring for unauthorized personnel, connections, devices, and software is performed	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
DE.CM-7	Monitoring for unauthorized personnel, connections, devices, and software is performed	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-7	Monitoring for unauthorized personnel, connections, devices, and software is performed	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-7	Monitoring for unauthorized personnel, connections, devices, and software is performed	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-7	Monitoring for unauthorized personnel, connections, devices, and software is performed	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-7	Monitoring for unauthorized personnel, connections, devices, and software is performed	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
DE.DP-4	Event detection information is communicated	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
DE.DP-4	Event detection information is communicated	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
DE.DP-4	Event detection information is communicated	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
DE.DP-4	Event detection information is communicated	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
DE.DP-4	Event detection information is communicated	s3-event-notifications-enabled	Amazon S3 event notifications can alert relevant personnel of any accidental or intentional modifications on your bucket objects. Example alerts include: new object is creation, object removal, object restoration, lost and replicated objects.

Control ID	Control Description	AWS Config Rule	Guidance
DE.DP-4	Event detection information is communicated	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
DE.DP-4	Event detection information is communicated	wafv2-logging-enabled	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
DE.DP-5	Detection processes are continuously improved	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-2	Software platforms and applications within the organization are inventoried	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-2	Software platforms and applications within the organization are inventoried	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-2	Software platforms and applications within the organizat ion are inventoried	ec2-stopped-instance	Enable this rule to help with the baseline configura tion of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
ID.AM-2	Software platforms and applications within the organizat ion are inventoried	eip-attached	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-2	Software platforms and applications within the organization are inventoried	vpc-network-acl-unused-check	This rule ensures that Amazon Virtual Private Cloud (VPC) network access control lists are in use. Monitoring for unused network access control lists can assist in accurate inventory and management of your environment.
ID.AM-3	Organizational communication and data flows are mapped	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-3	Organizational communication and data flows are mapped	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-3	Organizational communication and data flows are mapped	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-3	Organizational communication and data flows are mapped	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-3	Organizational communication and data flows are mapped	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-3	Organizational communication and data flows are mapped	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-3	Organizational communication and data flows are mapped	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	rds-multi-az-support	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (for example under duress/attack, during recovery, normal operations)	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
ID.RA-1	Asset vulnerabilities are identified and documented	rds-automatic-minor-version-upgrade-enabled	Enable automatic minor version upgrades on your Amazon Relational Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes.
ID.RA-1	Asset vulnerabilities are identified and documented	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
ID.RA-1	Asset vulnerabilities are identified and documented	elastic-beanstalk-managed-updates-enabled	Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems.
ID.RA-1	Asset vulnerabilities are identified and documented	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
ID.RA-2	Cyber threat intelligence is received from information sharing forums and sources	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
ID.RA-3	Threats, both internal and external, are identified and documented	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
ID.RA-3	Threats, both internal and external, are identified and documented	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
ID.RA-5	Threats, vulnerabilities, likelihoods, and impacts are used to determine risk	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
ID.RA-5	Threats, vulnerabi lities, likelihoods, and impacts are used to determine risk	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
ID.RA-5	Threats, vulnerabilities, likelihoods, and impacts are used to determine risk	rds-enhanced-monitoring-enabled	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
ID.RA-5	Threats, vulnerabilities, likelihoods, and impacts are used to determine risk	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
ID.SC-4	Suppliers and third-party partners are routinely assessed using audits, test results, or other forms of evaluations to confirm they are meeting their contractual obligations.	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
ID.SC-4	Suppliers and third-party partners are routinely assessed using audits, test results, or other forms of evaluatio ns to confirm they are meeting their contractual obligatio ns.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
ID.SC-4	Suppliers and third-party partners are routinely assessed using audits, test results, or other forms of evaluations to confirm they are meeting their contractual obligations.	rds-enhanced-monitoring-enabled	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
ID.SC-4	Suppliers and third-party partners are routinely assessed using audits, test results, or other forms of evaluatio ns to confirm they are meeting their contractual obligatio ns.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorize d devices, users and processes	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	ecs-task-definition-user-for-host-mode-check	If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	access-keys-rotated	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	emr-kerberos-enabled	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-group-has-users-check	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorize d devices, users and processes	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	secretsmanager-rotation-enabled-check	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorize d devices, users and processes	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa

Control ID	Control Description	AWS Config Rule	Guidance
			sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies.
PR.AC-3	Remote access is managed.	autoscaling-launch -config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associate d resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessibl e, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
PR.AC-3	Remote access is managed.	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
PR.AC-3	Remote access is managed.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
PR.AC-3	Remote access is managed.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
PR.AC-3	Remote access is managed.	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.AC-3	Remote access is managed.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.AC-3	Remote access is managed.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.AC-3	Remote access is managed.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	ec2-imdsv2-check	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	ecs-task-definition-user-for-host-mode-check	If a task definition has elevated privilege s it is because the customer has specifically opted-in to those configura tions. This control checks for unexpecte d privilege escalation when a task definitio n has host networkin g enabled but the customer has not opted-in to elevated privileges.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	ec2-instance-no-pu blic-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearc h Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	emr-kerberos-enabl ed	The access permissio ns and authoriza tions can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	iam-group-has-users-check	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	iam-policy-no-stat ements-with-admin-access	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	iam-user-unused-cr edentials-check	AWS Identity and Access Managemen t (IAM) can help you with access permissio ns and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentia ls, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsage Age (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communica tion between a function and other services within the Amazon VPC. With this configuration, there is no requireme nt for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearc h Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties	redshift-cluster-p ublic-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (for example, network segregation, network segmentation)	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-6	Identities are proofed and bound to credentials and asserted in interactions	emr-kerberos-enabled	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-6	Identities are proofed and bound to credentials and asserted in interacti ons	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa

Control ID	Control Description	AWS Config Rule	Guidance
			sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-7	Users, devices, and other assets are authenticated (for example, single-factor, multi-fac tor) commensur ate with the risk of the transaction (for example, individuals' security and privacy risks and other organizational risks)	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa

Control ID	Control Description	AWS Config Rule	Guidance
			sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies.
PR.AC-7	Users, devices, and other assets are authenticated (for example, single-factor, multi-fac tor) commensur ate with the risk of the transaction (for example, individuals' security and privacy risks and other organizational risks)	iam-user-mfa-enabl ed	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-fac tor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-7	Users, devices, and other assets are authenticated (for example, single-factor, multi-factor) commensurate with the risk of the transaction (for example, individuals' security and privacy risks and other organizational risks)	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-7	Users, devices, and other assets are authenticated (for example, single-factor, multi-factor) commensurate with the risk of the transaction (for example, individuals' security and privacy risks and other organizational risks)	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-7	Users, devices, and other assets are authenticated (for example, single-factor, multi-factor) commensurate with the risk of the transaction (for example, individuals' security and privacy risks and other organizational risks)	root-account-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
PR.AT-1	All users are informed and trained	security-awareness-program-exists (process check)	Establish and maintain a security awareness program for your organization. Security awareness programs educate employees on how to protect their organization from various security breaches or incidents.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	s3-default-encryption-kms	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	sagemaker-notebook-instance-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	sns-encrypted-kms	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	api-gw-cache-enabled-and-encrypted	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
PR.DS-1	Data-at-rest is protected	elasticsearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains.
PR.DS-1	Data-at-rest is protected	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	kms-cmk-not-scheduled-for-deletion	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
PR.DS-1	Data-at-rest is protected	opensearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	redshift-cluster-kms-enabled	To help protect data at rest, ensure encryption with AWS Key Managemen t Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	sagemaker-endpoint-configuration-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	secretsmanager-using-cmk	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-2	Data-in-transit is protected	elasticsearch-node-to-node-encryption-check	Ensure node-to-node encryptio n for Amazon OpenSearch Service is enabled. Node-to-node encryptio n enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
PR.DS-2	Data-in-transit is protected	elbv2-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-2	Data-in-transit is protected	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.
PR.DS-2	Data-in-transit is protected	opensearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-2	Data-in-transit is protected	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
PR.DS-2	Data-in-transit is protected	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-2	Data-in-transit is protected	elb-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
PR.DS-2	Data-in-transit is protected	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryptio n to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-2	Data-in-transit is protected	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-3	Assets are formally managed throughout removal, transfers, and disposition	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-3	Assets are formally managed throughout removal, transfers, and disposition	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-3	Assets are formally managed throughout removal, transfers, and disposition	eip-attached	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
PR.DS-4	Adequate capacity to ensure availability is maintained	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
PR.DS-4	Adequate capacity to ensure availability is maintained	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
PR.DS-4	Adequate capacity to ensure availability is maintained	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
PR.DS-4	Adequate capacity to ensure availability is maintained	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	rds-multi-az-support	Multi-AZ support in Amazon Relationa l Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availabil ity Zone. Each Availability Zone runs on its own physicall y distinct, independe nt infrastructure, and is engineered to be highly reliable. In case of an infrastru cture failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operation s as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
PR.DS-4	Adequate capacity to ensure availability is maintained	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
PR.DS-5	Protections against data leaks are implemented	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	cloudtrail-s3-data events-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
PR.DS-5	Protections against data leaks are implemented	codebuild-project-envvar-awscred-check	Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	codebuild-project-source-repo-url-check	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, sign-in credentials within AWS Codebuild project environments. Use OAuth instead of personal access tokens or sign-in credentials to grant authorization for accessing GitHub or Bitbucket repositor ies.
PR.DS-5	Protections against data leaks are implemented	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
PR.DS-5	Protections against data leaks are implemented	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.DS-5	Protections against data leaks are implemented	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.DS-5	Protections against data leaks are implemented	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.DS-5	Protections against data leaks are implemented	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-6	Integrity checking mechanisms are used to verify software, firmware, and information integrity	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-6	Integrity checking mechanisms are used to verify software, firmware, and information integrity	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and applicati on failures.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-7	The development and testing environment(s) are separate from the production environment	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-7	The development and testing environment(s) are separate from the production environment	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-7	The development and testing environment(s) are separate from the production environment	ec2-stopped-instance	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
PR.DS-7	The development and testing environment(s) are separate from the production environment	ec2-volume-inuse-check	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-7	The development and testing environment(s) are separate from the production environment	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-7	The development and testing environme nt(s) are separate from the production environment	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (for example concept of least functionality)	account-part-of-organizations	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (for example concept of least functionality)	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (for example concept of least functionality)	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (for example concept of least functionality)	ec2-stopped-instance	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (for example concept of least functionality)	ec2-volume-inuse-check	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (for example concept of least functionality)	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-2	A System Development Life Cycle to manage systems is implemented	codebuild-project-envvar-awscred-check	Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
PR.IP-2	A System Development Life Cycle to manage systems is implemented	codebuild-project-source-repo-url-check	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, sign-in credentials within AWS Codebuild project environments. Use OAuth instead of personal access tokens or sign-in credentials to grant authorization for accessing GitHub or Bitbucket repositories.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-2	A System Development Life Cycle to manage systems is implemented	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-3	Configuration change control processes are in place	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
PR.IP-3	Configuration change control processes are in place	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	dynamodb-in-backup -plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	redshift-backup-en abled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.
PR.IP-4	Backups of informati on are conducted , maintained, and tested	dynamodb-pitr-enab led	Enable this rule to check that informati on has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	redshift-cluster-m aintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organizat ion. Specifically, that they have preferred maintenan ce windows and automated snapshot retention periods for the database. This rule requires you to set the allowVers ionUpgrade. The default is true. It also lets you optionall y set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionP eriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of informati on are conducted , maintained, and tested	s3-bucket-replicat ion-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replicati on (CRR) supports maintaining adequate capacity and availabil ity. CRR enables automatic, asynchron ous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
PR.IP-4	Backups of informati on are conducted , maintained, and tested	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and applicati on failures.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-7	Protection processes are improved	ebs-optimized-instance	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
PR.IP-8	Effectiveness of protection technologies is shared	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-8	Effectiveness of protection technologies is shared	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
PR.IP-8	Effectiveness of protection technologies is shared	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-8	Effectiveness of protection technologies is shared	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
PR.IP-8	Effectiveness of protection technologies is shared	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-8	Effectiveness of protection technologies is shared	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.IP-8	Effectiveness of protection technologies is shared	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-8	Effectiveness of protection technologies is shared	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
PR.IP-8	Effectiveness of protection technologies is shared	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-8	Effectiveness of protection technologies is shared	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.IP-8	Effectiveness of protection technologies is shared	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-8	Effectiveness of protection technologies is shared	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-12	A vulnerability management plan is developed and implemented	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-12	A vulnerability management plan is developed and implemented	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-12	A vulnerability management plan is developed and implemented	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
PR.MA-2	Remote maintenance of organizational assets is approved, logged, and performed in a manner that prevents unauthorized access	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
PR.MA-2	Remote maintenance of organizational assets is approved, logged, and performed in a manner that prevents unauthorized access	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Communications and control networks are protected	opensearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	rds-enhanced-monitoring-enabled	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	wafv2-logging-enab led	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	api-gw-execution-l ogging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	cloudtrail-enabled	AWS CloudTrail can help in non-repud iation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated , and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	iam-user-no-policies-check	This rule ensures AWS Identity and Access Managemen t (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportuni ty for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.PT-3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
PR.PT-4	Communications and control networks are protected	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
PR.PT-4	Communications and control networks are protected	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
PR.PT-4	Communications and control networks are protected	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
PR.PT-4	Communications and control networks are protected	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.PT-4	Communications and control networks are protected	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.PT-4	Communications and control networks are protected	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.PT-4	Communications and control networks are protected	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	autoscaling-group-elb-healthcheck-required	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	rds-multi-az-support	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
RC.RP-1	Recovery plan is executed during or after a cybersecurity incident	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
RC.RP-1	Recovery plan is executed during or after a cybersecurity incident	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
RC.RP-1	Recovery plan is executed during or after a cybersecurity incident	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
RC.RP-1	Recovery plan is executed during or after a cybersecurity incident	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	Control Description	AWS Config Rule	Guidance
RS.AN-2	The impact of the incident is understood	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
RS.MI-3	Newly identified vulnerabilities are mitigated or documented as accepted risks	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	aurora-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	backup-recovery-point-encrypted	Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
RS.RP-1	Response plan is executed during or after an incident	backup-recovery-point-manual-deletion-disabled	Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance

This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	ec2-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
RS.RP-1	Response plan is executed during or after an incident	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	rds-multi-az-support	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
RS.RP-1	Response plan is executed during or after an incident	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
RS.RP-1	Response plan is executed during or after an incident	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Template

The template is available on GitHub: Operational Best Practices for NIST CSF.

Operational Best Practices for NIST Privacy Framework v1.0

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom

AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the NIST Privacy Framework and AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more NIST Privacy Framework controls. A NIST Privacy Framework control can be related to multiple AWS Config rules. Refer to the table below for more detail and guidance related to these mappings.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P7	Mechanisms for transmitting processing permissio ns and related data values with data elements are established and in place.	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Applicati on Load Balancer automatically redirects unencrypt ed HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
CT.DM-P7	Mechanisms for transmitting processing permissio ns and related data values with data elements are established and in place.	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configure d with SSL certifica tes to allow backend systems to authentic ate that requests originate from API Gateway.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P7	Mechanisms for transmitting processing permissio ns and related data values with data elements are established and in place.	elasticsearch-node-to-node-encryption-check	Ensure node-to-node encryptio n for Amazon OpenSearch Service is enabled. Node-to-node encryptio n enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P7	Mechanisms for transmitting processing permissions and related data values with data elements are established and in place.	opensearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
CT.DM-P7	Mechanisms for transmitting processing permissions and related data values with data elements are established and in place.	elb-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P7	Mechanisms for transmitting processing permissions and related data values with data elements are established and in place.	elbv2-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
CT.DM-P7	Mechanisms for transmitting processing permissions and related data values with data elements are established and in place.	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P7	Mechanisms for transmitting processing permissions and related data values with data elements are established and in place.	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
CT.DM-P7	Mechanisms for transmitting processing permissions and related data values with data elements are established and in place.	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	audit-log-policy-exists(Process Check)	Establish and maintain an audit log management policy that defines your organization's logging requirements. This includes, but is not limited to, review and retention of audit logs.
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	autoscaling-group-elb-healthcheck-required	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	cloudwatch-alarm-action-check	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	cw-loggroup-retention-period-check	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	dynamodb-throughput-limit-check	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	ec2-instance-detailed-monitoring-enabled	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	cloudtrail-security-trail-enabled	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	redshift-audit-logging-enabled	To capture information about connections and user activities on your Amazon Redshift cluster, ensure audit logging is enabled.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy and incorpora ting the principle of data minimization.	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	rds-enhanced-monitoring-enabled	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy and incorpora ting the principle of data minimization.	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy and incorpora ting the principle of data minimization.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	wafv2-logging-enabled	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy and incorpora ting the principle of data minimization.	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.
CT.DM-P8	Audit/log records are determine d, documented, implemented, and reviewed in accordance with policy and incorpora ting the principle of data minimization.	opensearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearc h Service error logs can assist with security and access audits, and can help to diagnose availabil ity issues.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
CT.DM-P8	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
ID.DE-P2	Data processing ecosystem parties (for example, service providers, customers, partners, product manufacturers, application developers) are identified, prioritized, and assessed using a privacy risk assessment process.	annual-risk-assessment-performed(Process Check)	Perform an annual risk assessment on your organization. Risk assessments can assist in determining the likelihood and impact of identified risks and/or vulnerabilities affecting an organization.
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes, and devices.	iam-user-group-membership-check	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes, and devices.	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes , and devices.	access-keys-rotated	The credentials are audited for authorize d devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromis ed. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes , and devices.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes , and devices.	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa

Control ID	Control Description	AWS Config Rule	Guidance
			sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes, and devices.	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes , and devices.	secretsmanager-rotation-enabled-check	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes, and devices.	emr-kerberos-enabled	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes, and devices.	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of sign-in credentials. Reduce the incidents of compromised accounts by requiring MFA for users.
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes, and devices.	s3-bucket-policy-grantee-check	Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes, and devices.	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes, and devices.	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes, and devices.	ecs-task-definition-user-for-host-mode-check	If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes , and devices.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes , and devices.	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
PR.AC-P1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized individuals, processes , and devices.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
PR.AC-P3	Remote access is managed.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
PR.AC-P3	Remote access is managed.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
PR.AC-P3	Remote access is managed.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.AC-P3	Remote access is managed.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.AC-P3	Remote access is managed.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P3	Remote access is managed.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.
PR.AC-P3	Remote access is managed.	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	ec2-imdsv2-check	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-b ased controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	emr-kerberos-enabl ed	The access permissio ns and authoriza tions can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
PR.AC-P4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties.	iam-group-has-users-check	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	iam-policy-no-stat ements-with-admin-access	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
PR.AC-P4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties.	iam-user-group-membership-check	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	iam-user-unused-cr edentials-check	AWS Identity and Access Managemen t (IAM) can help you with access permissio ns and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentia ls, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsage Age (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties.	s3-bucket-policy-grantee-check	Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
PR.AC-P4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties.	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	ec2-instance-no-pu blic-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearc h Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearc h Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	emr-master-no-publ ic-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P4	Access permissio ns and authoriza tions are managed, incorporating the principles of least privilege and separation of duties.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communica tion between a function and other services within the Amazon VPC. With this configuration, there is no requireme nt for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P6	Individuals and devices are proofed and bound to credentials, and authenticated commensurate with the risk of the transaction (for example, individuals' security and privacy risks and other organizational risks).	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-P6	Individuals and devices are proofed and bound to credentials, and authenticated commensurate with the risk of the transaction (for example, individuals' security and privacy risks and other organizational risks).	root-account-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
PR.DS-P1	Data-at-rest are protected.	api-gw-cache-enabled-and-encrypted	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P1	Data-at-rest are protected.	cloudtrail-security-trail-enabled	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
PR.DS-P1	Data-at-rest are protected.	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P1	Data-at-rest are protected.	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
PR.DS-P1	Data-at-rest are protected.	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
PR.DS-P1	Data-at-rest are protected.	elasticsearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P1	Data-at-rest are protected.	opensearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains.
PR.DS-P1	Data-at-rest are protected.	redshift-cluster-kms-enabled	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P1	Data-at-rest are protected.	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
PR.DS-P1	Data-at-rest are protected.	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P1	Data-at-rest are protected.	s3-default-encryption-kms	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P1	Data-at-rest are protected.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P1	Data-at-rest are protected.	sagemaker-endpoint-configuration-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
PR.DS-P1	Data-at-rest are protected.	sagemaker-notebook-instance-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P1	Data-at-rest are protected.	secretsmanager-using-cmk	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data.
PR.DS-P1	Data-at-rest are protected.	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P1	Data-at-rest are protected.	sns-encrypted-kms	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
PR.DS-P1	Data-at-rest are protected.	kms-cmk-not-scheduled-for-deletion	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P1	Data-at-rest are protected.	dynamodb-table-encrypted-kms	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
PR.DS-P2	Data-in-transit are protected.	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P2	Data-in-transit are protected.	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configure d with SSL certifica tes to allow backend systems to authentic ate that requests originate from API Gateway.
PR.DS-P2	Data-in-transit are protected.	elb-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
PR.DS-P2	Data-in-transit are protected.	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P2	Data-in-transit are protected.	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
PR.DS-P4	Adequate capacity to ensure availability is maintained.	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
PR.DS-P4	Adequate capacity to ensure availability is maintained.	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	rds-multi-az-support	Multi-AZ support in Amazon Relationa l Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availabil ity Zone. Each Availability Zone runs on its own physicall y distinct, independe nt infrastructure, and is engineered to be highly reliable. In case of an infrastru cture failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operation s as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
PR.DS-P4	Adequate capacity to ensure availability is maintained.	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	ebs-optimized-instance	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
PR.DS-P4	Adequate capacity to ensure availability is maintained.	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	aurora-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	backup-recovery-point-encrypted	Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
PR.DS-P4	Adequate capacity to ensure availability is maintained.	backup-recovery-point-manual-deletion-disabled	Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	backup-recovery-point-minimum-retention-check	To help with data back-up processes, ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredRetentionDays (config default: 35) parameter. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	ec2-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P4	Adequate capacity to ensure availability is maintained.	fsx-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon FSx file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
PR.DS-P5	Protections against data leaks are implemented.	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	cloudtrail-security-trail-enabled	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
PR.DS-P5	Protections against data leaks are implemented.	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	codebuild-project-envvar-awscred-check	Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
PR.DS-P5	Protections against data leaks are implemented.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
PR.DS-P5	Protections against data leaks are implemented.	vpc-flow-logs-enab led	The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interface s in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
PR.DS-P5	Protections against data leaks are implemented.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
PR.DS-P5	Protections against data leaks are implemented.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.DS-P5	Protections against data leaks are implemented.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.DS-P5	Protections against data leaks are implemented.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-P5	Protections against data leaks are implemented.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.
PR.DS-P6	Integrity checking mechanisms are used to verify software, firmware, and information integrity.	cloudtrail-security-trail-enabled	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	Control Description	AWS Config Rule	Guidance
PR.MA-P2	Remote maintenance of organizational assets is approved, logged, and performed in a manner that prevents unauthorized access.	cloudtrail-security-trail-enabled	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
PR.MA-P2	Remote maintenance of organizational assets is approved, logged, and performed in a manner that prevents unauthorized access.	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P1	A baseline configuration of information technology is created and maintained incorporating security principles (for example, concept of least functionality).	cloudtrail-security-trail-enabled	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P1	A baseline configuration of information technology is created and maintained incorporating security principles (for example, concept of least functionality).	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P1	A baseline configuration of information technology is created and maintained incorporating security principles (for example, concept of least functionality).	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P1	A baseline configuration of information technology is created and maintained incorporating security principles (for example, concept of least functionality).	ec2-stopped-instance	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
PR.PO-P1	A baseline configuration of information technology is created and maintained incorporating security principles (for example, concept of least functionality).	ec2-volume-inuse-check	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P1	A baseline configuration of information technology is created and maintained incorporating security principles (for example, concept of least functionality).	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P1	A baseline configura tion of information technology is created and maintaine d incorporating security principles (for example, concept of least functiona lity).	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P1	A baseline configuration of information technology is created and maintained incorporating security principles (for example, concept of least functionality).	account-part-of-organizations	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
AT-1: PR.PO-P10	A vulnerability management plan is developed and implemented.	vuln-management-plan-exists(Process Check)	Ensure a vulnerability management plan is developed and implemented in order to have a formally defined processes to address vulnerabilities in your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P2	Configuration change control processes are established and in place.	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
PR.PO-P2	Configuration change control processes are established and in place.	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	dynamodb-in-backup -plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	dynamodb-pitr-enab led	Enable this rule to check that informati on has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	ebs-optimized-inst ance	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/ O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contentio n between Amazon EBS I/O operations and other traffic from your instance.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	redshift-backup-en abled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	s3-bucket-replicat ion-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replicati on (CRR) supports maintaining adequate capacity and availabil ity. CRR enables automatic, asynchron ous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and applicati on failures.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	redshift-cluster-m aintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organizat ion. Specifically, that they have preferred maintenan ce windows and automated snapshot retention periods for the database. This rule requires you to set the allowVers ionUpgrade. The default is true. It also lets you optionall y set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionP eriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	aurora-resources-p rotected-by-backup-plan	To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	backup-plan-min-fr equency-and-min-re tention-check	To help with data back-up processes , ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredF requencyValue (Config default: 1), requiredRetentionD ays (Config default: 35) and requiredF requencyUnit (Config default: days) parameters. The actual value should reflect your organizat ions requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	backup-recovery-po int-encrypted	Ensure that encryptio n is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	backup-recovery-po int-manual-deletion-disabled	Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventin g accidental or intentional deletion.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	backup-recovery-po int-minimum-retent ion-check	To help with data back-up processes , ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup complianc e requirements. This rule allows you to set the requiredRetentionD ays (config default: 35) parameter. The actual value should reflect your organizat ions requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	ec2-resources-prot ected-by-backup-pl an	To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P3	Backups of informati on are conducted , maintained, and tested.	fsx-resources-prot ected-by-backup-pl an	To help with data back-up processes, ensure your Amazon FSx file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	aurora-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	backup-recovery-point-encrypted	Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	backup-recovery-point-manual-deletion-disabled	Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	backup-recovery-point-minimum-retention-check	To help with data back-up processes, ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredRetentionDays (config default: 35) parameter. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	ec2-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PO-P7	Response plans (Incident Response and Business Continuity) and recovery plans (Incident Recovery and Disaster Recovery) are established, in place, and managed.	fsx-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon FSx file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
PR.PO-P8	Response and recovery plans are tested.	response-plan-tested(Process Check)	Ensure Incident response and recovery plans are tested. This can assist in understanding if your plan will be effective during an incident and if any gaps or updates need to be addressed.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	lambda-function-pu blic-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potential ly lead to degradati on of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	s3-bucket-policy-grantee-check	Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.
PR.PT-P2	The principle of least functionality is incorporated by configuring systems to provide only essential capabilities.	redshift-enhanced-vpc-routing-enabled	Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
PR.PT-P3	Communications and control networks are protected.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
PR.PT-P3	Communications and control networks are protected.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
PR.PT-P3	Communications and control networks are protected.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
PR.PT-P3	Communications and control networks are protected.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.PT-P3	Communications and control networks are protected.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.PT-P3	Communications and control networks are protected.	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.
PR.PT-P3	Communications and control networks are protected.	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P3	Communications and control networks are protected.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
PR.PT-P3	Communications and control networks are protected.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	autoscaling-group-elb-healthcheck-required	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	rds-multi-az-support	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	aurora-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	backup-recovery-point-encrypted	Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	backup-recovery-point-manual-deletion-disabled	Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	backup-recovery-point-minimum-retention-check	To help with data back-up processes, ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredRetentionDays (config default: 35) parameter. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	ec2-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-P4	Mechanisms (for example, failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations.	fsx-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon FSx file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Template

The template is available on GitHub: Operational Best Practices for NIST Privacy Framework v1.0.

Operational Best Practices for NYDFS 23

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the New York State Department Of Financial Services (NYDFS) cybersecurity requirements for financial services companies (23 NYCRR 500) and

AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more US NYDFS controls. A US NYDFS 23 NYCRR 500 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	api-gw-cache-enabled-and-encrypted	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	cloudwatch-log-group-encrypted	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	elasticsearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confident iality, integrity and availability of the Covered Entity's Information Systems.	elb-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confident iality, integrity and availability of the Covered Entity's Information Systems.	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryptio n is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	sagemaker-endpoint-configuration-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confident iality, integrity and availability of the Covered Entity's Information Systems.	sagemaker-notebook-instance-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confident iality, integrity and availability of the Covered Entity's Information Systems.	sns-encrypted-kms	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	alb-http-drop-invalid-header-enabled	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	kinesis-stream-encrypted	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Kinesis Streams.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	elasticsearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	rds-multi-az-support	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confident iality, integrity and availability of the Covered Entity's Information Systems.	s3-bucket-default-lock-enabled	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	autoscaling-group-elb-healthcheck-required	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	backup-recovery-point-encrypted	Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	beanstalk-enhanced-health-reporting-enabled	AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	dynamodb-table-encrypted-kms	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	ec2-instance-detailed-monitoring-enabled	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	elbv2-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	s3-default-encryption-kms	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	opensearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	opensearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confident iality, integrity and availability of the Covered Entity's Information Systems.	codebuild-project-artifact-encryption	To help protect sensitive data at rest, ensure encryption is enabled for your AWS CodeBuild artifacts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecu rity functions: (2) use defensive infrastructure and the implement ation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unau thorized access, use or other malicious acts.	emr-kerberos-enabl ed	The access permissio ns and authoriza tions can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	iam-group-has-users-check	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPa

Control ID	Control Description	AWS Config Rule	Guidance
			sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	iam-user-group-membership-check	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of sign-in credentials. Reduce the incidents of compromised accounts by requiring MFA for users.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	root-account-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	s3-bucket-policy-grantee-check	Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	ec2-imdsv2-check	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	internet-gateway-authorized-vpc-only	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecu rity functions: (2) use defensive infrastructure and the implement ation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unau thorized access, use or other malicious acts.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	api-gw-associated-with-waf	AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	opensearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecurity functions: (3) detect Cybersecurity Events.	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
500.02(b)(3)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecurity functions: (3) detect Cybersecurity Events.	cloudtrail-enabled	AWS CloudTrail can help in non-repud iation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated , and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	redshift-audit-logging-enabled	To capture information about connections and user activities on your Amazon Redshift cluster, ensure audit logging is enabled.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	ec2-instance-detailed-monitoring-enabled	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	rds-enhanced-monitoring-enabled	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecurity functions: (3) detect Cybersecurity Events.	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	opensearch-audit-logging-enabled	Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecurity functions: (3) detect Cybersecurity Events.	codebuild-project-logging-enabled	Ensure AWS CodeBuild project logging is enabled so that your build output logs are sent to either Amazon CloudWatch or Amazon Simple Storage Service (Amazon S3). Build output logs provide detailed informati on about your build project.
500.02(b)(3)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecurity functions: (3) detect Cybersecurity Events.	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecurity functions: (3) detect Cybersecurity Events.	wafv2-logging-enab led	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	ebs-optimized-instance	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	dynamodb-in-backup -plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecu rity program shall be based on the Covered Entity's Risk Assessment and designed to perfor m the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	backup-recovery-point-manual-deletion-disabled	Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion.

Control ID	Control Description	AWS Config Rule	Guidance
500.05	The cybersecurity program for each covered entity shall include monitoring and testing, developed in accordance with the covered entity's risk assessment, designed to assess the effectiveness of the covered entity's cybersecurity program. The monitoring and testing shall include continuous monitoring or periodic penetration testing and vulnerability assessments. Absent effective continuous monitoring, or other systems to detect, on an ongoing basis, changes in information systems that may create or indicate vulnerabilities, covered entities shall conduct: (a) annual penetration testing of the covered entity's information systems determined	vuln-management-plan-exists (process check)	Ensure a vulnerability management plan is developed and implemented in order to have a formally defined processes to address vulnerabilities in your environment.

Control ID	Control Description	AWS Config Rule	Guidance
	each given year based on relevant identifie d risks in accordanc e with the risk assessment; and (b) bi-annual vulnerabi lity assessmen ts, including any systematic scans or reviews of informati on systems reasonabl y designed to identify publicly known cybersecu rity vulnerabilities in the covered entity's information systems based on the risk assessment.		

Control ID	Control Description	AWS Config Rule	Guidance
500.06(a)	(a) Each Covered Entity shall securely maintain systems that, to the extent applicable and based on its Risk Assessment: (1) are designed to reconstruct material financial transactions sufficient to support normal operations and obligations of the Covered Entity; and (2) include audit trails designed to detect and respond to Cybersecurity Events that have a reasonable likelihood of materially harming any material part of the normal operations of the Covered Entity.	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
500.06(a)	(a) Each Covered Entity shall securely maintain systems that, to the extent applicable and based on its Risk Assessment: (1) are designed to reconstruct material financial transactions sufficient to support normal operations and obligations of the Covered Entity; and (2) include audit trails designed to detect and respond to Cybersecurity Events that have a reasonable likelihood of materially harming any material part of the normal operations of the Covered Entity.	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
500.06(a)	(a) Each Covered Entity shall securely maintain systems that, to the extent applicable and based on its Risk Assessment: (1) are designed to reconstruct material financial transactions sufficient to support normal operations and obligations of the Covered Entity; and (2) include audit trails designed to detect and respond to Cybersecurity Events that have a reasonable likelihood of materially harming any material part of the normal operations of the Covered Entity.	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance

OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearc h Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	access-keys-rotated	The credentials are audited for authorize d devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromis ed. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	ecs-task-definition-user-for-host-mode-check	If a task definition has elevated privilege s it is because the customer has specifically opted-in to those configura tions. This control checks for unexpecte d privilege escalation when a task definitio n has host networkin g enabled but the customer has not opted-in to elevated privileges.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	no-unrestricted-ro ute-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	s3-account-level-p ublic-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthori zed remote users by preventing public access. This rule allows you to optionally set the ignorePub licAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPubl icAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	iam-user-unused-cr edentials-check	AWS Identity and Access Managemen t (IAM) can help you with access permissio ns and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentia ls, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsage Age (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	secretsmanager-rot ation-enabled-check	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potential ly reduce the business impact if the secret is compromised.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	secretsmanager-sch eduled-rotation-su ccess-check	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	emr-kerberos-enabl ed	The access permissio ns and authoriza tions can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	iam-group-has-users-check	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa

Control ID	Control Description	AWS Config Rule	Guidance
			sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	iam-policy-no-stat ements-with-admin-access	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	iam-user-group-membership-check	AWS Identity and Access Managemen t (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	iam-user-no-policies-check	This rule ensures AWS Identity and Access Managemen t (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportuni ty for an identity to receive or retain excessive privileges.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	s3-bucket-policy-g rantee-check	Manage access to the AWS Cloud by enabling s3_ bucket_policy_gran tee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principal s, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	ec2-instance-no-pu blic-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearc h Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	emr-master-no-publ ic-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	internet-gateway-a uthorized-vpc-only	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	lambda-function-pu blic-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potential ly lead to degradati on of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communica tion between a function and other services within the Amazon VPC. With this configuration, there is no requireme nt for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	redshift-cluster-p ublic-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	s3-bucket-public-r ead-prohibited	Manage access to resources in the AWS Cloud by only allowing authorize d users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	s3-bucket-public-w rite-prohibited	Manage access to resources in the AWS Cloud by only allowing authorize d users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Informati on and shall per iodically review such access privileges.	sagemaker-notebook -no-direct-internet- access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
500.8(a)	(a) Each Covered Entity's cybersecurity program shall include written procedures, guidelines and standards designed to ensure the use of secure development practices for in-house developed applications utilized by the Covered Entity, and procedures for evaluating, assessing or testing the security of externally developed applications utilized by the Covered Entity within the context of the Covered Entity's technology environment.	codebuild-project-envvar-awscred-check	Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.

Control ID	Control Description	AWS Config Rule	Guidance
500.8(a)	(a) Each Covered Entity's cybersecurity program shall include written procedure s, guidelines and standards designed to ensure the use of secure developme nt practices for in-house developed applications utilized by the Covered Entity, and procedure s for evaluating, assessing or testing the security of externally developed applications utilized by the Covered Entity within the context of the Covered Entity's technology environment.	codebuild-project-source-repo-url-check	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, sign-in credentials within AWS Codebuild project environments. Use OAuth instead of personal access tokens or sign-in credentials to grant authorization for accessing GitHub or Bitbucket repositor ies.

Control ID	Control Description	AWS Config Rule	Guidance
500.09	(a) Each covered entity shall conduct a periodic risk assessment of the covered entity's information systems sufficient to inform the design of the cybersecurity program as required by this Part. Such risk assessment shall be updated as reasonably necessary to address changes to the covered entity's information systems, nonpublic informati on or business operations. The covered entity's risk assessment shall allow for revision of controls to respond to technological developments and evolving threats and shall consider the particular risks of the covered entity's business operations related to cybersecu rity, nonpublic information collected	annual-risk-assess ment-performed (process check)>	Perform an annual risk assessment on your organization. Risk assessments can assist in determini ng the likelihood and impact of identified risks and/or vulnerabi lities affecting an organization.

Control ID	Control Description	AWS Config Rule	Guidance
	or stored, informati on systems utilized and the availability and effectiveness of controls to protect nonpublic informati on and information systems.		

Control ID	Control Description	AWS Config Rule	Guidance
500.12	(a) Multi-Factor Authentication. Based on its Risk Assessment, each Covered Entity shall use effective controls, which may include Multi-Factor Authentication or Risk-Based Authentication, to protect against unauthorized access to Nonpublic Information or Information Systems. (b) Multi-Factor Authentication shall be utilized for any individual accessing the Covered Entity's internal networks from an external network, unless the Covered Entity's CISO has approved in writing the use of reasonably equivalent or more secure access controls.	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of sign-in credentials. Reduce the incidents of compromised accounts by requiring MFA for users.

Control ID	Control Description	AWS Config Rule	Guidance
500.12	(a) Multi-Factor Authentication. Based on its Risk Assessment, each Covered Entity shall use effective controls, which may include Multi-Factor Authentication or Risk-Based Authentication, to protect against unauthorized access to Nonpublic Information or Information Systems. (b) Multi-Factor Authentication shall be utilized for any individual accessing the Covered Entity's internal networks from an external network, unless the Covered Entity's CISO has approved in writing the use of reasonably equivalent or more secure access controls.	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
500.12	(a) Multi-Factor Authentication. Based on its Risk Assessment, each Covered Entity shall use effective controls, which may include Multi-Factor Authentication or Risk-Based Authentication, to protect against unauthorized access to Nonpublic Information or Information Systems. (b) Multi-Factor Authentication shall be utilized for any individual accessing the Covered Entity's internal networks from an external network, unless the Covered Entity's CISO has approved in writing the use of reasonably equivalent or more secure access controls.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance

The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	cloudwatch-alarm-action-check	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	cw-loggroup-retention-period-check	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	rds-logging-enabled	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	codebuild-project-logging-enabled	Ensure AWS CodeBuild project logging is enabled so that your build output logs are sent to either Amazon CloudWatch or Amazon Simple Storage Service (Amazon S3). Build output logs provide detailed information about your build project.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	wafv2-logging-enabled	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	opensearch-audit-logging-enabled	Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	redshift-audit-logging-enabled	To capture information about connections and user activities on your Amazon Redshift cluster, ensure audit logging is enabled.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	opensearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(b)	As part of its cybersecurity program, each covered entity shall: (b) provide regular cybersecurity awareness training for all personnel that is updated to reflect risks identified by the covered entity in its risk assessment.	security-awareness-program-exists (process check)	Establish and maintain a security awareness program for your organization. Security awareness programs educate employees on how to protect their organization from various security breaches or incidents.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	opensearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	opensearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	api-gw-cache-enabled-and-encrypted	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	cloudwatch-log-group-encrypted	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	elasticsearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	elb-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	sagemaker-endpoint-configuration-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	sagemaker-notebook-instance-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	sns-encrypted-kms	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	alb-http-drop-invalid-header-enabled	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	elasticsearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	dynamodb-table-encrypted-kms	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	elbv2-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	redshift-cluster-kms-enabled	To help protect data at rest, ensure encryption with AWS Key Managemen t Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	s3-default-encrypt ion-kms	Ensure that encryptio n is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	secretsmanager-using-cmk	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	backup-recovery-point-encrypted	Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	codebuild-project-artifact-encryption	To help protect sensitive data at rest, ensure encryption is enabled for your AWS CodeBuild artifacts.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	kinesis-stream-encrypted	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Kinesis Streams.

Control ID	Control Description	AWS Config Rule	Guidance
500.16	(a) As part of its cybersecurity program, each covered entity shall establish a written incident response plan designed to promptly respond to, and recover from, any cybersecurity event materially affecting the confidentiality, integrity or availabil ity of the covered entity's informati on systems or the continuing functiona lity of any aspect of the covered entity's business or operation s.	response-plan-exists-maintained (process check)	Ensure incident response plans are established, maintained, and distributed to responsible personnel .

Template

The template is available on GitHub: Operational Best Practices for NYDFS 23.

Operational Best Practices for NZISM 3.9 (Extension)

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the New Zealand Government Communications Security Bureau (GCSB) Information Security Manual (NZISM) 2025-11 Version 3.9 and AWS Managed Config rules. Each Config rule applies to a specific AWS resource type, and relates to one or more NZISM controls. An NZISM control can be related to multiple Config rules. Refer to the following table for more detail and guidance related to these mappings. Only controls representing recommended or baseline practice for information classified RESTRICTED and below are included in the mappings.

This sample conformance pack template contains mappings to controls within the NZISM framework, which is an integral part of the Protective Security Requirements (PSR) framework that sets out the New Zealand Government's expectations for the management of personnel, information and physical security.

The Foundation part of this conformance pack can be deployed to the Sydney and global regions. The NZ Transition part contains the subset of Foundation Config rules that are currently available in the New Zealand region. The Foundation part will not currently deploy to the New Zealand region. The Extension part of this conformance pack can be deployed to the Sydney and New Zealand regions to augment the Config rules provided in the Foundation and NZ Transition parts.

The NZISM is licensed under the Creative Commons Attribution 4.0 New Zealand licence, available at https://creativecommons.org/licenses/by/4.0/. Copyright information can be found at NZISM New Zealand Information Security Manual | Legal, Privacy, and Copyright.

Control ID	Control Description	AWS Config Rule	Guidance
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	api-gw-cache-enabled-and-encrypted	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. An exemption is available for

Control ID	Control Description	AWS Config Rule	Guidance
			pre-production environments.
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	s3-default-encryption-kms	To help protect data at rest, ensure that encryption is enabled for your S3 buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. For more information about the encryption process and administration, use the AWS Key Management Service (AWS KMS) customer-managed CMKs. An exemption is available for buckets containing non-sensitive data provided SSE is enabled.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment. An exemption is available if the load balancer is the origin for a CloudFront distribution with WAF enabled.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	api-gw-associated-with-waf	This control checks whether an API Gateway stage uses a AWS WAF web access control list (ACL). This control fails if a AWS WAF Regional web ACL is not attached to a REST API Gateway stage. AWS WAF is a web application firewall that helps protect web applications and APIs from attacks. It enables you to configure an ACL, which is a set of rules that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure that your API Gateway stage is associated with an AWS WAF web ACL to help protect it from malicious attacks. An exemption is available if the API Gateway is the origin for a CloudFront

Control ID	Control Description	AWS Config Rule	Guidance
			distribution with WAF enabled.
4333	Data managemen t, Content Filtering , Content validation (20.3.7.C.02.)	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
4333	Data managemen t, Content Filtering , Content validation (20.3.7.C.02.)	api-gw-associated-with-waf	This control checks whether an API Gateway stage uses a AWS WAF web access control list (ACL). This control fails if a AWS WAF Regional web ACL is not attached to a REST API Gateway stage. AWS WAF is a web application firewall that helps protect web applications and APIs from attacks. It enables you to configure an ACL, which is a set of rules that allow, block, or count web requests based on customiza ble web security rules and condition s that you define. Ensure that your API Gateway stage is associated with an AWS WAF web ACL to help protect it from malicious attacks. An exemption is available if the API Gateway is the origin for a CloudFront

Control ID	Control Description	AWS Config Rule	Guidance
			distribution with WAF enabled.

Control ID	Control Description	AWS Config Rule	Guidance
4829	Enterprise systems security, Cloud Computing, System Availability (22.1.23.C.01.)	rds-cluster-multi-az-enabled	Amazon Aurora stores copies of the data in a DB cluster across multiple Availability Zones in a single AWS Region. Aurora stores these copies regardles s of whether the instances in the DB cluster span multiple Availability Zones. When data is written to the primary DB instance, Aurora synchronously replicates the data across Availability Zones to six storage nodes associated with your cluster volume. Doing so provides data redundanc y, eliminates I/O freezes, and minimizes latency spikes during system backups. Running a DB instance with high availability can enhance availabil ity during planned system maintenance, and help protect your

Control ID	Control Description	AWS Config Rule	Guidance
			databases against failure and Availability Zone disruption. This rule checks if Multi-AZ replication is enabled on Amazon Aurora clusters managed by Amazon Relational Database Service (RDS). An exemption is available for pre-production environments.

Control ID	Control Description	AWS Config Rule	Guidance
4829	Enterprise systems security, Cloud Computing, System Availability (22.1.23.C.01.)	rds-multi-az-support	Multi-AZ support in Amazon Relational Database Service (RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. An exemption

Control ID	Control Description	AWS Config Rule	Guidance
			is available for pre-production environments.
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	sns-encrypted-kms	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. An exemption is available when messages published to the topic do not contain sensitive data.

Control ID	Control Description	AWS Config Rule	Guidance
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. An exemption is available when a compensating recovery solution has been configured.

Control ID	Control Description	AWS Config Rule	Guidance
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup complianc e requirements. An exemption is available when a compensating recovery solution has been configured.

Control ID	Control Description	AWS Config Rule	Guidance
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup complianc e requirements. An exemption is available when a compensating recovery solution has been configured.

Control ID	Control Description	AWS Config Rule	Guidance
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup complianc e requirements. An exemption is available when a compensating recovery solution has been configured.

Control ID	Control Description	AWS Config Rule	Guidance
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures. An exemption is available when only a single variant of an object will be created, or when a compensat ing recovery solution has been configured.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	api-gw-associated-with-waf	This control checks whether an API Gateway stage uses a AWS WAF web access control list (ACL). This control fails if a AWS WAF Regional web ACL is not attached to a REST API Gateway stage. AWS WAF is a web application firewall that helps protect web applications and APIs from attacks. It enables you to configure an ACL, which is a set of rules that allow, block, or count web requests based on customiza ble web security rules and condition s that you define. Ensure that your API Gateway stage is associated with an AWS WAF web ACL to help protect it from malicious attacks. An exemption is available if the API Gateway is the origin for a CloudFront

Operational Best Practices for NZISM 3.9 (Foundation)

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the New Zealand Government Communications Security Bureau (GCSB) Information Security Manual (NZISM) 2025-11 Version 3.9 and AWS Managed Config rules. Each Config rule applies to a specific AWS resource type, and relates to one or more NZISM controls. An NZISM control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings. Only controls representing recommended or baseline practice for information classified RESTRICTED and below are included in the mappings.

This sample conformance pack template contains mappings to controls within the NZISM framework, which is an integral part of the Protective Security Requirements (PSR) framework that sets out the New Zealand Government's expectations for the management of personnel, information and physical security.

The Foundation part of this conformance pack can be deployed to the Sydney and global regions. The NZ Transition part contains the subset of Foundation Config rules that are currently available in the New Zealand region. The Foundation part will not currently deploy to the New Zealand region. The Extension part of this conformance pack can be deployed to the Sydney and New Zealand regions in order to augment the Config rules provided in the Foundation and NZ Transition parts.

The NZISM is licensed under the Creative Commons Attribution 4.0 New Zealand licence, available at https://creativecommons.org/licenses/by/4.0/. Copyright information can be found at NZISM New Zealand Information Security Manual | Legal, Privacy, and Copyright.

Control ID	Control Description	AWS Config Rule	Guidance
1149	Software security, Standard Operating Environments, Developing hardened SOEs (14.1.8.C.01.)	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
1149	Software security, Standard Operating Environments, Developing hardened SOEs (14.1.8.C.01.)	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your

Control ID	Control Description	AWS Config Rule	Guidance
			managed instances and allows you to set baselines of operating system patch levels, software installations, application configura tions, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
1149	Software security, Standard Operating Environments, Developing hardened SOEs (14.1.8.C.01.)	ecs-containers-non privileged	This control checks if the privileged parameter in the container definitio n of Amazon ECS Task Definitions is set to true. The control fails if this parameter is equal to true. This control only evaluates the latest active revision of an Amazon ECS task definition. We recommend that you remove elevated privileges from your ECS task definitions. When the privilege parameter is true, the container is given elevated privileges on the host container instance (similar to the root user).

Control ID	Control Description	AWS Config Rule	Guidance
1149	Software security, Standard Operating Environments, Developing hardened SOEs (14.1.8.C.01.)	ecs-containers-readonly-access	This control checks if Amazon ECS containers are limited to read-only access to mounted root filesystems. This control fails if the ReadonlyRootFilesystem parameter in the container definition of Amazon ECS task definitions is set to false. This control only evaluates the latest active revision of an Amazon ECS task definition. Enabling this option reduces security attack vectors since the container instance's filesystem cannot be tampered with or written to unless it has explicit read-write permissions on its filesystem folder and directories. This control also adheres to the principle of least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
1154	Information Security Incidents, Detecting Information Security Incidents, Preventin g and detecting information security incidents (7.1.7.C.02.)	guardduty-runtime-monitoring-enabled	This control checks if Runtime Monitorin g is enabled for Amazon GuardDuty in your account or organization. Runtime Monitorin g observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment.

Control ID	Control Description	AWS Config Rule	Guidance
1661	Software security, Web Application Development, Agency website content (14.5.6.C.01.)	cloudfront-default-root-object-configured	This control checks whether an Amazon CloudFront distribution is configured to return a specific object, that is the default root object. The control fails if the CloudFront distribution does not have a default root object configured. A user might sometimes request the distribution's root URL instead of an object in the distribution. When this happens, specifying a default root object can help you to avoid exposing the contents of your web distribution. This rule must be applied in the us-east-1 region. Deploy with template parameter DeployEdgeRules = true.

Control ID	Control Description	AWS Config Rule	Guidance
1667	Software security, Web Application Development, Web applications (14.5.8.C.01.)	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration. The value is 90 days.
1667	Software security, Web Application Development, Web applications (14.5.8.C.01.)	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
1841	Access Control and Passwords, Identification, Authentication and Passwords, Methods for system user identification and authentication (16.1.35.C.02.)	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
1841	Access Control and Passwords, Identification, Authentication and Passwords, Methods for system user identification and authentication (16.1.35.C.02.)	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that multi-factor authentication (MFA) is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
1841	Access Control and Passwords, Identification, Authentication and Passwords, Methods for system user identification and authentication (16.1.35.C.02.)	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware multi-factor authentication (MFA) is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
1841	Access Control and Passwords, Identification, Authentication and Passwords, Methods for system user identification and authentication (16.1.35.C.02.)	root-account-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring multi-factor authentication (MFA) is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
1847	Access Control and Passwords, Identification, Authentication and Passwords, Protecting authentication data in transit (16.1.37.C.01.)	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
1847	Access Control and Passwords, Identification, Authentication and Passwords, Protecting authentication data in transit (16.1.37.C.01.)	cloudfront-viewer-policy-https	This control checks whether an Amazon CloudFront distribution requires viewers to use HTTPS directly or whether it uses redirection. The control fails if ViewerProtocolPolicy is set to allow-all for defaultCacheBehavior or for cacheBehaviors. HTTPS (TLS) can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Only encrypted connections over HTTPS (TLS) should be allowed. This rule must be applied in the us-east-1 region. Deploy with template parameter DeployEdgeRules = true.

Control ID	Control Description	AWS Config Rule	Guidance
1847	Access Control and Passwords, Identification, Authentication and Passwords, Protecting authentication data in transit (16.1.37.C.01.)	elasticsearch-node-to-node-encryption-check	This control checks whether Elasticsearch domains have node-to-node encryption enabled. This control fails if node-to-node encryption is disabled on the domain. HTTPS (TLS) can be used to help prevent potential attackers from eavesdropping on or manipulating network traffic using person-in-the-middle or similar attacks. Only encrypted connections over HTTPS (TLS) should be allowed. Enabling node-to-node encryption for Elasticsearch domains ensures that intra-cluster communications are encrypted in transit.

Control ID	Control Description	AWS Config Rule	Guidance
1847	Access Control and Passwords, Identification, Authentication and Passwords, Protecting authentication data in transit (16.1.37.C.01.)	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
1847	Access Control and Passwords, Identification, Authentication and Passwords, Protecting authentication data in transit (16.1.37.C.01.)	opensearch-node-to-node-encryption-check	This control checks whether OpenSearch domains have node-to-node encryption enabled. This control fails if node-to-node encryption is disabled on the domain. HTTPS (TLS) can be used to help prevent potential attackers from eavesdropping on or manipulating network traffic using person-in-the-middle or similar attacks. Only encrypted connections over HTTPS (TLS) should be allowed. Enabling node-to-node encryption for OpenSearch domains ensures that intra-cluster communications are encrypted in transit.

Control ID	Control Description	AWS Config Rule	Guidance
1893	Access Control and Passwords, Identification, Authentication and Passwords, Suspension of access (16.1.46.C.02.)	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule sets maxCredentialUsageAge to 30 days.

Control ID	Control Description	AWS Config Rule	Guidance
1946	Access Control and Passwords, Privileged User Access, Use of privileged accounts (16.3.5.C.02.)	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
1946	Access Control and Passwords, Privileged User Access, Use of privileged accounts (16.3.5.C.02.)	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
1998	Access Control and Passwords, Event Logging and Auditing, Maintaining system management logs (16.6.6.C.02.)	cloud-trail-cloud-watch-logs-enabled	You should configure CloudTrail with CloudWatch Logs to monitor your trail logs and be notified when specific activity occurs. This rule checks whether AWS CloudTrail trails are configured to send logs to Amazon CloudWatch logs.

Control ID	Control Description	AWS Config Rule	Guidance
1998	Access Control and Passwords, Event Logging and Auditing, Maintaining system management logs (16.6.6.C.02.)	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
1998	Access Control and Passwords, Event Logging and Auditing, Maintaining system management logs (16.6.6.C.02.)	cw-loggroup-retention-period-check	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. The minimum retention is 18 months.

Control ID	Control Description	AWS Config Rule	Guidance
2013	Access Control and Passwords, Event Logging and Auditing, Additional events to be logged (16.6.10.C.02.)	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
2013	Access Control and Passwords, Event Logging and Auditing, Additional events to be logged (16.6.10.C.02.)	cloudfront-accesslogs-enabled	This control checks whether server access logging is enabled on CloudFront distributions. The control fails if access logging is not enabled for a distribution. CloudFront access logs provide detailed information about every user request that CloudFront receives. Each log contains information such as the date and time the request was received, the IP address of the viewer that made the request, the source of the request, and the port number of the request from the viewer. These logs are useful for applications such as security and access audits and forensics investigation. This rule must be applied in the us-east-1 region. Deploy with template

Control ID	Control Description	AWS Config Rule	Guidance
			parameter DeployEdgeRules = true
2013	Access Control and Passwords, Event Logging and Auditing, Additional events to be logged (16.6.10.C.02.)	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
2013	Access Control and Passwords, Event Logging and Auditing, Additional events to be logged (16.6.10.C.02.)	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
2013	Access Control and Passwords, Event Logging and Auditing, Additional events to be logged (16.6.10.C.02.)	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
2013	Access Control and Passwords, Event Logging and Auditing, Additional events to be logged (16.6.10.C.02.)	wafv2-logging-enabled	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
2022	Access Control and Passwords, Event Logging and Auditing, Event log protection (16.6.12.C.01.)	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
2022	Access Control and Passwords, Event Logging and Auditing, Event log protection (16.6.12.C.01.)	cloudwatch-log-group-encrypted	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
2028	Access Control and Passwords, Event Logging and Auditing, Event log archives (16.6.13.C.01.)	cw-loggroup-retention-period-check	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. The minimum retention is 18 months.
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryptio n is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	elasticsearch-encrypted-at-rest	This control checks whether Elasticsearch domains have encryption-at-rest configuration enabled. The check fails if encryption at rest is not enabled. For an added layer of security for sensitive data, you should configure your Elasticsearch Service domain to be encrypted at rest. When you configure encryption of data at rest, Amazon Key Management Service (KMS) stores and manages your encryption keys. To perform the encryption, AWS KMS uses the Advanced Encryption Standard algorithm with 256-bit keys (AES-256).

Control ID	Control Description	AWS Config Rule	Guidance
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	encrypted-volumes	Because senstive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	opensearch-encrypted-at-rest	This control checks whether OpenSearch domains have encryption-at-rest configuration enabled. The check fails if encryption at rest is not enabled. For an added layer of security for sensitive data, you should configure your OpenSearch Service domain to be encrypted at rest. When you configure encryption of data at rest, Amazon Key Management Service (KMS) stores and manages your encryption keys. To perform the encryption, AWS KMS uses the Advanced Encryption Standard algorithm with 256-bit keys (AES-256).

Control ID	Control Description	AWS Config Rule	Guidance
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
2090	Cryptography, Cryptographic Fundamentals, Information and Systems Protection (17.1.55.C.02.)	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
2090	Cryptography, Cryptographic Fundamentals, Information and Systems Protection (17.1.55.C.02.)	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.
2090	Cryptography, Cryptographic Fundamentals, Information and Systems Protection (17.1.55.C.02.)	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
2598	Cryptography, Transport Layer Security, Using TLS (17.4.16.C.01.)	elb-custom-security-policy-ssl-check	To help protect data in transit, ensure that your Classic ElasticLoadBalancer SSL listeners are using a custom security policy. These policies can provide various high-strength cryptographic algorithms to help ensure encrypted network communications between systems. This rule requires that you set a custom security policy for your SSL listeners. The security policy is: Protocol-TLSv1.2,ECDHE-ECDSA-AES128-GCM-SHA256.

Control ID	Control Description	AWS Config Rule	Guidance
2600	Cryptography, Transport Layer Security, Using TLS (17.4.16.C.02.)	elb-custom-security-policy-ssl-check	To help protect data in transit, ensure that your Classic ElasticLoadBalancer SSL listeners are using a custom security policy. These policies can provide various high-strength cryptographic algorithms to help ensure encrypted network communications between systems. This rule requires that you set a custom security policy for your SSL listeners. The default security policy is: Protocol-TLSv1.2,ECDHE-ECDSA-AES128-GCM-SHA256.

Control ID	Control Description	AWS Config Rule	Guidance
2726	Cryptography, Secure Shell, Automated remote access (17.5.8.C.02.)	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
3021	Cryptography, Key Management, Contents of KMPs (17.9.25.C.01.)	cmk-backing-key-rotation-enabled	Amazon Key Management Service (KMS) enables customers to rotate the backing key, which is key material stored in AWS KMS and is tied to the key ID of the customer managed key (CMK). It's the backing key that is used to perform cryptographic operations such as encryption and decryption. Automated key rotation currently retains all previous backing keys so that decryption of encrypted data can take place transparently. Rotating encryption keys helps reduce the potential impact of a compromised key because data encrypted with a new key can't be accessed with a previous key that might have been exposed.

Control ID	Control Description	AWS Config Rule	Guidance
3205	Network security, Network Managemen t, Limiting network access (18.1.13.C.02.)	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. The authorized Internet port list is: 443 only

Control ID	Control Description	AWS Config Rule	Guidance
3449	Product Security, Product Patching and Updating, Patching vulnerabilities in products (12.4.4.C .02.)	ec2-managedinstance-patch-compliance-status-check	Enable rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organisation's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
3449	Product Security, Product Patching and Updating, Patching vulnerabilities in products (12.4.4.C .02.)	ecr-private-image-scanning-enabled	This control checks whether a private Amazon Elastic Container Registry (ECR) repository has image scanning configured. This control fails if a private ECR repositor y doesn't have image scanning configure d. Note that you must also configure scan on push for each repositor y to pass this control. ECR image scanning helps in identifying software vulnerabilities in your container images. ECR uses the Common Vulnerabi lities and Exposures (CVEs) database from the open-sour ce Clair project and provides a list of scan findings. Enabling image scanning on ECR repositories adds a layer of verification for the integrity and

Control ID	Control Description	AWS Config Rule	Guidance
			safety of the images being stored.
3449	Product Security, Product Patching and Updating, Patching vulnerabilities in products (12.4.4.C .02.)	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule sets allowVersionUpgrade to true.
3451	Product Security, Product Patching and Updating, Patching vulnerabilities in products (12.4.4.C .04.)	ec2-managedinstance-patch-compliance-status-check	Enable rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organisation's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
3452	Product Security, Product Patching and Updating, Patching vulnerabilities in products (12.4.4.C .05.)	ec2-managedinstance-patch-compliance-status-check	Enable rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organisation's policies and procedures.
3452	Product Security, Product Patching and Updating, Patching vulnerabilities in products (12.4.4.C .05.)	elastic-beanstalk-managed-updates-enabled	This control checks whether managed platform updates are enabled for the Elastic Beanstalk environment. Enabling managed platform updates ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is an important step in securing systems.

Control ID	Control Description	AWS Config Rule	Guidance
3452	Product Security, Product Patching and Updating, Patching vulnerabilities in products (12.4.4.C .05.)	rds-automatic-minor-version-upgrade-enabled	This control checks whether automatic minor version upgrades are enabled for the Amazon Relational Database Service (RDS) database instance. Enabling automatic minor version upgrades ensures that the latest minor version updates to the relational database management system (RDBMS) are installed. These upgrades might include security patches and bug fixes. Keeping up to date with patch installation is an important step in securing systems.

Control ID	Control Description	AWS Config Rule	Guidance
3453	Product Security, Product Patching and Updating, Patching vulnerabilities in products (12.4.4.C .06.)	ec2-managedinstance-patch-compliance-status-check	Enable rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organisation's policies and procedures.
3453	Product Security, Product Patching and Updating, Patching vulnerabilities in products (12.4.4.C .06.)	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule sets allowVersionUpgrade to true.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	cloudfront-associated-with-waf	This control checks whether CloudFront distributions are associated with either AWS WAF or AWS WAFv2 web ACLs. The control fails if the distribution is not associated with a web ACL. AWS WAF is a web application firewall that helps protect web applications and APIs from attacks. It allows you to configure a set of rules, called a web access control list (web ACL), that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your CloudFront distribution is associated with an AWS WAF web ACL to help protect it from malicious attacks. This rule must be applied in the us-east-1 region. Deploy with template

Control ID	Control Description	AWS Config Rule	Guidance
			parameter DeployEdgeRules = true.
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	dms-replication-not-public	Manage access to the AWS Cloud by ensuring AWS Database Migration Service (DMS) replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	ec2-imdsv2-check	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	elasticsearch-in-vpc-only	This control checks whether Elasticsearch domains are in a virtual private cloud (VPC). It does not evaluate the VPC subnet routing configuration to determine public access. You should ensure that Elasticsearch domains are not attached to public subnets. Elasticsearch domains deployed within a VPC can communicate with VPC resources over the private AWS network, without the need to traverse the public internet. This configuration increases the security posture by limiting access to the data in transit. VPCs provide a number of network controls to secure access to Elasticsearch domains, including network ACL and security groups

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic MapReduce (EMR) cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	opensearch-in-vpc-only	This control checks whether OpenSearch domains are in a virtual private cloud (VPC). It does not evaluate the VPC subnet routing configuration to determine public access. You should ensure that OpenSearch domains are not attached to public subnets. OpenSearch domains deployed within a VPC can communicate with VPC resources over the private AWS network, without the need to traverse the public internet. This configuration increases the security posture by limiting access to the data in transit. VPCs provide a number of network controls to secure access to OpenSearch domains, including network ACL and security groups.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule sets ignorePublicAcls to True, blockPublicPolicy to True, blockPublicAcls to True, and restrictPublicBuckets to True.
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	vpc-flow-logs-enabled	The virtual private cloud (VPC) flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
3623	Gateway security, Gateways, Demilitarised zones (19.1.14.C.02.)	elasticsearch-in-vpc-only	This control checks whether Elasticsearch domains are in a virtual private cloud (VPC). It does not evaluate the VPC subnet routing configuration to determine public access. You should ensure that Elasticsearch domains are not attached to public subnets. Elasticsearch domains deployed within a VPC can communicate with VPC resources over the private AWS network, without the need to traverse the public internet. This configuration increases the security posture by limiting access to the data in transit. VPCs provide a number of network controls to secure access to Elasticsearch domains, including network ACL and security groups.

Control ID	Control Description	AWS Config Rule	Guidance
3623	Gateway security, Gateways, Demilitarised zones (19.1.14.C.02.)	opensearch-in-vpc-only	This control checks whether OpenSearch domains are in a virtual private cloud (VPC). It does not evaluate the VPC subnet routing configuration to determine public access. You should ensure that OpenSearch domains are not attached to public subnets. OpenSearch domains deployed within a VPC can communicate with VPC resources over the private AWS network, without the need to traverse the public internet. This configuration increases the security posture by limiting access to the data in transit. VPCs provide a number of network controls to secure access to OpenSearch domains, including network ACL and security groups.

Control ID	Control Description	AWS Config Rule	Guidance
3623	Gateway security, Gateways, Demilitarised zones (19.1.14.C.02.)	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
3623	Gateway security, Gateways, Demilitarised zones (19.1.14.C.02.)	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3815	Network security, Intrusion Detection and Prevention, IDS/IPS Maintenance (18.4.9.C.01.)	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3857	Network security, Intrusion Detection and Prevention, Configuring the IDS/IPS (18.4.11.C.01.)	guardduty-eks-protection-audit-enabled	This control checks whether GuardDuty EKS Audit Log Monitoring is enabled. GuardDuty EKS Audit Log Monitoring helps you detect potentially suspicious activities in your Amazon Elastic Kubernetes Service (Amazon EKS) clusters. EKS Audit Log Monitoring uses Kubernetes audit logs to capture chronological activities from users, applications using the Kubernetes API, and the control plane.

Control ID	Control Description	AWS Config Rule	Guidance
3857	Network security, Intrusion Detection and Prevention, Configuring the IDS/IPS (18.4.11.C.01.)	guardduty-eks-protection-runtime-enabled	This control checks whether GuardDuty EKS Runtime Monitoring with automated agent management is enabled. EKS Protection in Amazon GuardDuty provides threat detection coverage to help you protect Amazon EKS clusters within your AWS environment. EKS Runtime Monitoring uses operating system-level events to help you detect potential threats in EKS nodes and containers within your EKS clusters.

Control ID	Control Description	AWS Config Rule	Guidance
3857	Network security, Intrusion Detection and Prevention, Configuring the IDS/IPS (18.4.11.C.01.)	guardduty-lambda-protection-enabled	This control checks whether GuardDuty Lambda Protection is enabled. GuardDuty Lambda Protection helps you identify potential security threats when an AWS Lambda function gets invoked. After your enable Lambda Protection, GuardDuty starts monitoring Lambda network activity logs associated with the Lambda functions in your AWS account. When a Lambda function gets invoked and GuardDuty identifies suspicious network traffic that indicates the presence of a potentially malicious piece of code in your Lambda function, GuardDuty generates a finding.

Control ID	Control Description	AWS Config Rule	Guidance
3857	Network security, Intrusion Detection and Prevention, Configuring the IDS/IPS (18.4.11.C.01.)	guardduty-s3-protection-enabled	This control checks whether GuardDuty S3 Protection is enabled. S3 Protection enables GuardDuty to monitor object-level API operations to identify potential security risks for data within your Amazon S3 buckets. GuardDuty monitors threats against your S3 resources by analyzing AWS CloudTrail management events and CloudTrail S3 data events.
3875	Network security, Intrusion Detection and Prevention, Event management and correlation (18.4.12.C.01.)	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3875	Network security, Intrusion Detection and Prevention, Event management and correlation (18.4.12. C.01.)	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
4441	Data management, Databases, Database files (20.4.4.C.02.)	elasticsearch-encrypted-at-rest	This control checks whether Elasticsearch domains have encryption-at-rest configuration enabled. The check fails if encryption at rest is not enabled. For an added layer of security for sensitive data, you should configure your Elasticsearch Service domain to be encrypted at rest. When you configure encryption of data at rest, Amazon Key Management Service (KMS) stores and manages your encryption keys. To perform the encryption, AWS KMS uses the Advanced Encryption Standard algorithm with 256-bit keys (AES-256).

Control ID	Control Description	AWS Config Rule	Guidance
4441	Data management, Databases, Database files (20.4.4.C.02.)	opensearch-encrypted-at-rest	This control checks whether OpenSearch domains have encryption-at-rest configuration enabled. The check fails if encryption at rest is not enabled. For an added layer of security for sensitive data, you should configure your OpenSearch Service domain to be encrypted at rest. When you configure encryption of data at rest, Amazon Key Management Service (KMS) stores and manages your encryption keys. To perform the encryption, AWS KMS uses the Advanced Encryption Standard algorithm with 256-bit keys (AES-256).

Control ID	Control Description	AWS Config Rule	Guidance
4441	Data management, Databases, Database files (20.4.4.C.02.)	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.
4441	Data management, Databases, Database files (20.4.4.C.02.)	rds-snapshot-encry pted	Ensure that encryptio n is enabled for your Amazon Relationa l Database Service (RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4441	Data management, Databases, Database files (20.4.4.C.02.)	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relationa l Database Service (RDS) instances are not public. Amazon RDS database instances can contain sensitive informati on and principles and access control is required for such accounts.
4441	Data management, Databases, Database files (20.4.4.C.02.)	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relationa l Database Service (RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4441	Data management, Databases, Database files (20.4.4.C.02.)	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule sets clusterDbEncrypted to true, and loggingEnabled to true.

Control ID	Control Description	AWS Config Rule	Guidance
4445	Data management, Databases, Accountability (20.4.5.C.02.)	rds-logging-enabled	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
4445	Data management, Databases, Accountability (20.4.5.C.02.)	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule sets clusterDbEncrypted to true, and loggingEnabled to true.

Control ID	Control Description	AWS Config Rule	Guidance
4829	Enterprise systems security, Cloud Computing, System Availability (22.1.23.C.01.)	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
4829	Enterprise systems security, Cloud Computing, System Availability (22.1.23.C.01.)	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled Availability Zone. It also improves your application's ability to handle the loss of one or more instances.
4838	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.03.)	cloudtrail-s3-data events-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
4838	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.03.)	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring Amazon Elastic Block Store (EBS) snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
4838	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.03.)	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule sets ignorePublicAcls to True, blockPublicPolicy to True, blockPublicAcls to True, and restrictPublicBuckets to True.

Control ID	Control Description	AWS Config Rule	Guidance
4838	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.03.)	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
4838	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.03.)	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	dynamodb-table-encrypted-kms	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned Key Management Service (KMS) key.
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	elasticsearch-encrypted-at-rest	This control checks whether Elasticsearch domains have encryption-at-rest configuration enabled. The check fails if encryption at rest is not enabled. For an added layer of security for sensitive data, you should configure your Elasticsearch Service domain to be encrypted at rest. When you configure encryption of data at rest, Amazon Key Management Service (KMS) stores and manages your encryption keys. To perform the encryption, AWS KMS uses the Advanced Encryption Standard algorithm with 256-bit keys (AES-256).

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	elasticsearch-node-to-node-encryption-check	This control checks whether Elasticsearch domains have node-to-node encryption enabled. This control fails if node-to-node encryption is disabled on the domain. HTTPS (TLS) can be used to help prevent potential attackers from eavesdropping on or manipulat ing network traffic using person-in -the-middle or similar attacks. Only encrypted connectio ns over HTTPS (TLS) should be allowed. Enabling node-to-n ode encryption for Elasticsearch domains ensures that intra-cluster communica tions are encrypted in transit.

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	opensearch-encrypted-at-rest	This control checks whether OpenSearch domains have encryption-at-rest configuration enabled. The check fails if encryption at rest is not enabled. For an added layer of security for sensitive data, you should configure your OpenSearch Service domain to be encrypted at rest. When you configure encryption of data at rest, Amazon Key Management Service (KMS) stores and manages your encryption keys. To perform the encryption, AWS KMS uses the Advanced Encryption Standard algorithm with 256-bit keys (AES-256).

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	opensearch-node-to-node-encryption-check	This control checks whether OpenSearch domains have node-to-node encryption enabled. This control fails if node-to-node encryption is disabled on the domain. HTTPS (TLS) can be used to help prevent potential attackers from eavesdropping on or manipulating network traffic using person-in-the-middle or similar attacks. Only encrypted connections over HTTPS (TLS) should be allowed. Enabling node-to-node encryption for OpenSearch domains ensures that intra-cluster communications are encrypted in transit.

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule sets clusterDbEncrypted to true, and loggingEnabled to true.
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	sagemaker-endpoint-configuration-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	sagemaker-notebook-instance-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Managemen t Service (KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	secretsmanager-using-cmk	To help protect data at rest, ensure encryption with AWS Key Managemen t Service (KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	db-instance-backup-enabled	The backup feature of Amazon Relationa l Database Service (RDS) creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	dynamodb-pitr-enab led	Enable this rule to check that informati on has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	rds-cluster-deletion-protection-enabled	Ensure Amazon Relational Database Service (RDS) instances have deletion protection enabled. Use deletion protection to prevent your RDS instances from being accidenta lly or malicious ly deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB per node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
6843	Access Control and Passwords, Privileged Access Management, The Principle of Least Privilege (16.4.31. C.02.)	mfa-enabled-for-iam-console-access	Multi-factor authentication (MFA) adds extra security by requiring users to provide unique authentication from an AWS-supported MFA mechanism , in addition to their regular sign-in credentials, when they access AWS websites or services. Supported mechanisms include U2F security keys, virtual or hardware MFA devices, and SMS-based codes. This rule checks whether AWS MFA is enabled for all AWS Identity and Access Management (IAM) users that use a console password. The rule is compliant if MFA is enabled.

Control ID	Control Description	AWS Config Rule	Guidance
6843	Access Control and Passwords, Privileged Access Management, The Principle of Least Privilege (16.4.31. C.02.)	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware multi-factor authentication (MFA) is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
6852	Access Control and Passwords, Privileged Access Management, Suspension and Revocation of Privileged Access Credentials (16.4.33.C.01.)	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule sets maxCredentialUsageAge to 30 days.
6860	Access Control and Passwords, Privileged Access Management, Monitoring and Review (16.4.35.C.02.)	cloud-trail-cloud-watch-logs-enabled	You should configure CloudTrail with CloudWatch Logs to monitor your trail logs and be notified when specific activity occurs. This rule checks whether AWS CloudTrail trails are configured to send logs to Amazon CloudWatch logs.

Control ID	Control Description	AWS Config Rule	Guidance
6860	Access Control and Passwords, Privileged Access Management, Monitoring and Review (16.4.35.C.02.)	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
6861	Access Control and Passwords, Privileged Access Management, Monitoring and Review (16.4.35.C.03.)	cloudtrail-security-trail-enabled	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple Regions.

Control ID	Control Description	AWS Config Rule	Guidance
6953	Access Control and Passwords, Multi-Factor Authentication, System Architecture and Security Controls (16.7.34.C.02.)	mfa-enabled-for-iam-console-access	Multi-factor authentication (MFA) adds extra security by requiring users to provide unique authentication from an AWS-supported MFA mechanism , in addition to their regular sign-in credentials, when they access AWS websites or services. Supported mechanisms include U2F security keys, virtual or hardware MFA devices, and SMS-based codes. This rule checks whether AWS MFA is enabled for all AWS Identity and Access Management (IAM) users that use a console password. The rule is compliant if MFA is enabled.

Control ID	Control Description	AWS Config Rule	Guidance
6953	Access Control and Passwords, Multi-Factor Authentication, System Architecture and Security Controls (16.7.34.C.02.)	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware multi-factor authentication (MFA) is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
7436	Public Cloud Security, Identity Managemen t and Access Control, Username and passwords (23.3.19. C.01.)	iam-user-mfa-enabl ed	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-fac tor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protectio n on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
7436	Public Cloud Security, Identity Managemen t and Access Control, Username and passwords (23.3.19. C.01.)	mfa-enabled-for-ia m-console-access	Manage access to resources in the AWS Cloud by ensuring that multi-factor authentication (MFA) is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protectio n on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
7436	Public Cloud Security, Identity Managemen t and Access Control, Username and passwords (23.3.19. C.01.)	root-account-hardw are-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware multi-fac tor authentication (MFA) is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
7436	Public Cloud Security, Identity Managemen t and Access Control, Username and passwords (23.3.19. C.01.)	root-account-mfa-e nabled	Manage access to resources in the AWS Cloud by ensuring multi-fac tor authentication (MFA) is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
7437	Public Cloud Security, Identity Management and Access Control, Username and passwords (23.3.19.C.01.)	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
7437	Public Cloud Security, Identity Managemen t and Access Control, Username and passwords (23.3.19. C.01.)	mfa-enabled-for-ia m-console-access	Manage access to resources in the AWS Cloud by ensuring that multi-factor authentication (MFA) is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protectio n on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
7437	Public Cloud Security, Identity Managemen t and Access Control, Username and passwords (23.3.19. C.01.)	root-account-hardw are-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware multi-fac tor authentication (MFA) is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
7437	Public Cloud Security, Identity Managemen t and Access Control, Username and passwords (23.3.19. C.01.)	root-account-mfa-e nabled	Manage access to resources in the AWS Cloud by ensuring multi-fac tor authentication (MFA) is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10. C.01.)	dms-replication-not-public	Manage access to the AWS Cloud by ensuring AWS Database Migration Service (DMS) replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	ec2-imdsv2-check	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within anAmazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	elasticsearch-in-vpc-only	This control checks whether Elasticsearch domains are in a virtual private cloud (VPC). It does not evaluate the VPC subnet routing configuration to determine public access. You should ensure that Elasticsearch domains are not attached to public subnets. Elasticsearch domains deployed within a VPC can communicate with VPC resources over the private AWS network, without the need to traverse the public internet. This configuration increases the security posture by limiting access to the data in transit. VPCs provide a number of network controls to secure access to Elasticsearch domains, including network ACL and security groups

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic MapReduce (EMR) cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	opensearch-in-vpc-only	This control checks whether OpenSearch domains are in a virtual private cloud (VPC). It does not evaluate the VPC subnet routing configuration to determine public access. You should ensure that OpenSearch domains are not attached to public subnets. OpenSearch domains deployed within a VPC can communicate with VPC resources over the private AWS network, without the need to traverse the public internet. This configuration increases the security posture by limiting access to the data in transit. VPCs provide a number of network controls to secure access to OpenSearch domains, including network ACL and security groups.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule sets ignorePublicAcls to True, blockPublicPolicy to True, blockPublicAcls to True, and restrictPublicBuckets to True.
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	vpc-flow-logs-enabled	The virtual private cloud (VPC) flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requirements (23.5.11.C.01.)	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requirements (23.5.11.C.01.)	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requirements (23.5.11.C.01.)	cloudfront-accesslogs-enabled	This control checks whether server access logging is enabled on CloudFront distributions. The control fails if access logging is not enabled for a distribution. CloudFront access logs provide detailed information about every user request that CloudFront receives. Each log contains information such as the date and time the request was received, the IP address of the viewer that made the request, the source of the request, and the port number of the request from the viewer. These logs are useful for applications such as security and access audits and forensics investigation. This rule must be applied in the us-east-1 region.

Control ID	Control Description	AWS Config Rule	Guidance
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requirements (23.5.11.C.01.)	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requirements (23.5.11.C.01.)	cloudwatch-log-group-encrypted	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requirements (23.5.11.C.01.)	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requireme nts (23.5.11.C.01.)	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requirements (23.5.11.C.01.)	wafv2-logging-enabled	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
7545	Access Control and Passwords, Identification, Authentication and Authentication, Passwords and policy (16.1.31.C.02.)	iam-password-policy	Ensure annual password changes on systems that have not implemented multi-factor authentication (MFA) or passwordless authentication.

Control ID	Control Description	AWS Config Rule	Guidance
7546	Access Control and Passwords, Identification, Authentication and Authentication, Passwords and policy (16.1.31.C.03.)	iam-password-policy	Ensure a minimum password length of 16 characters (e.g four words). Passwords must be long, strong and unique. No explicit complexity requirements are enforced (e.g. numbers or special characters), however passwords must be unique, or random and may include special characters and numbers to achieve this.

Operational Best Practices for NZISM 3.9 (NZ Transition)

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the New Zealand Government Communications Security Bureau (GCSB) Information Security Manual (NZISM) 2025-11 Version 3.9 and AWS Managed Config rules. Each Config rule applies to a specific AWS resource type, and relates to one or more NZISM controls. An NZISM control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings. Only controls representing recommended or baseline practice for information classified RESTRICTED and below are included in the mappings.

This sample conformance pack template contains mappings to controls within the NZISM framework, which is an integral part of the Protective Security Requirements (PSR) framework that sets out the New Zealand Government's expectations for the management of personnel, information and physical security.

The Foundation part of this conformance pack can be deployed to the Sydney and global regions. The NZ Transition part contains the subset of Foundation Config rules that are currently available in the New Zealand region. The Foundation part will not currently deploy to the New Zealand

region. The Extension part of this conformance pack can be deployed to the Sydney and New Zealand regions in order to augment the Config rules provided in the Foundation and NZ Transition parts.

Control ID	Control Description	AWS Config Rule	Guidance
1661	Software security, Web Application Development, Agency website content (14.5.6.C.01.)	cloudfront-default-root-object-configured	This control checks whether an Amazon CloudFront distribution is configured to return a specific object that is the default root object. The control fails if the CloudFront distribution does not have a default root object configured. A user might sometimes request the distribution's root URL instead of an object in the distribution. When this happens, specifying a default root object can help you to avoid exposing the contents of your web distribution. This rule must be applied in the us-east-1 region. Deploy with template

Control ID	Control Description	AWS Config Rule	Guidance
			parameter DeployEdgeRules = true
1667	Software security, Web Application Development, Web applications (14.5.8.C.01.)	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration. The value is 30 days.
1667	Software security, Web Application Development, Web applications (14.5.8.C.01.)	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
1847	Access Control and Passwords, Identification, Authentication and Passwords, Protecting authentication data in transit (16.1.37.C.01.)	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
1847	Access Control and Passwords, Identification, Authentication and Passwords, Protecting authentication data in transit (16.1.37.C.01.)	cloudfront-viewer-policy-https	This control checks whether an Amazon CloudFront distribution requires viewers to use HTTPS directly or whether it uses redirection. The control fails if ViewerProtocolPolicy is set to allow-all for defaultCacheBehavior or for cacheBehaviors. HTTPS (TLS) can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Only encrypted connections over HTTPS (TLS) should be allowed. This rule must be applied in the us-east-1 region. Deploy with template parameter DeployEdgeRules = true

Control ID	Control Description	AWS Config Rule	Guidance
1847	Access Control and Passwords, Identification, Authentication and Passwords, Protecting authentication data in transit (16.1.37.C.01.)	elasticsearch-node-to-node-encryption-check	This control checks whether Elasticsearch domains have node-to-node encryption enabled. This control fails if node-to-node encryption is disabled on the domain. HTTPS (TLS) can be used to help prevent potential attackers from eavesdropping on or manipulating network traffic using person-in-the-middle or similar attacks. Only encrypted connections over HTTPS (TLS) should be allowed. Enabling node-to-node encryption for Elasticsearch domains ensures that intra-cluster communications are encrypted in transit.

Control ID	Control Description	AWS Config Rule	Guidance
1847	Access Control and Passwords, Identification, Authentication and Passwords, Protecting authentication data in transit (16.1.37.C.01.)	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.
1998	Access Control and Passwords, Event Logging and Auditing, Maintaining system management logs (16.6.6.C.02.)	cloud-trail-cloud-watch-logs-enabled	You should configure CloudTrail with CloudWatch Logs to monitor your trail logs and be notified when specific activity occurs. This rule checks whether AWS CloudTrail trails are configured to send logs to Amazon CloudWatch logs.

Control ID	Control Description	AWS Config Rule	Guidance
1998	Access Control and Passwords, Event Logging and Auditing, Maintaining system management logs (16.6.6.C.02.)	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
1998	Access Control and Passwords, Event Logging and Auditing, Maintaining system management logs (16.6.6.C.02.)	cw-loggroup-retention-period-check	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. The minimum retention is 18 months.

Control ID	Control Description	AWS Config Rule	Guidance
2013	Access Control and Passwords, Event Logging and Auditing, Additional events to be logged (16.6.10.C.02.)	cloudfront-accesslogs-enabled	This control checks whether server access logging is enabled on CloudFront distributions. The control fails if access logging is not enabled for a distribution. CloudFront access logs provide detailed information about every user request that CloudFront receives. Each log contains information such as the date and time the request was received, the IP address of the viewer that made the request, the source of the request, and the port number of the request from the viewer. These logs are useful for applications such as security and access audits and forensics investigation. This rule must be applied in the us-east-1 region. Deploy with template

Control ID	Control Description	AWS Config Rule	Guidance
			parameter DeployEdgeRules = true
2013	Access Control and Passwords, Event Logging and Auditing, Additional events to be logged (16.6.10.C.02.)	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
2013	Access Control and Passwords, Event Logging and Auditing, Additional events to be logged (16.6.10.C.02.)	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
2013	Access Control and Passwords, Event Logging and Auditing, Additional events to be logged (16.6.10.C.02.)	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
2022	Access Control and Passwords, Event Logging and Auditing, Event log protection (16.6.12.C.01.)	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
2022	Access Control and Passwords, Event Logging and Auditing, Event log protection (16.6.12.C.01.)	cloudwatch-log-group-encrypted	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
2028	Access Control and Passwords, Event Logging and Auditing, Event log archives (16.6.13.C.01.)	cw-loggroup-retention-period-check	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. The minimum retention is 18 months.
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryptio n is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	elasticsearch-encrypted-at-rest	This control checks whether Elasticsearch domains have encryption-at-rest configuration enabled. The check fails if encryption at rest is not enabled. For an added layer of security for sensitive data, you should configure your Elasticsearch Service domain to be encrypted at rest. When you configure encryption of data at rest, Amazon Key Management Service (KMS) stores and manages your encryption keys. To perform the encryption, AWS KMS uses the Advanced Encryption Standard algorithm with 256-bit keys (AES-256).

Control ID	Control Description	AWS Config Rule	Guidance
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
2082	Cryptography, Cryptographic Fundamentals, Reducing storage and physical transfer requirements (17.1.53.C.04.)	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
2090	Cryptography, Cryptographic Fundamentals, Information and Systems Protection (17.1.55.C.02.)	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
2090	Cryptography, Cryptographic Fundamentals, Information and Systems Protection (17.1.55.C.02.)	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.
2090	Cryptography, Cryptographic Fundamentals, Information and Systems Protection (17.1.55.C.02.)	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
2598	Cryptography, Transport Layer Security, Using TLS (17.4.16.C.01.)	elb-custom-security-policy-ssl-check	To help protect data in transit, ensure that your Classic ElasticLoadBalancer SSL listeners are using a custom security policy. These policies can provide various high-strength cryptographic algorithms to help ensure encrypted network communications between systems. This rule requires that you set a custom security policy for your SSL listeners. The security policy is: Protocol-TLSv1.2,ECDHE-ECDSA-AES256-GCM-SHA384.

Control ID	Control Description	AWS Config Rule	Guidance
2600	Cryptography, Transport Layer Security, Using TLS (17.4.16.C.02.)	elb-custom-security-policy-ssl-check	To help protect data in transit, ensure that your Classic ElasticLoadBalance r SSL listeners are using a custom security policy. These policies can provide various high-stre ngth cryptogra phic algorithm s to help ensure encrypted network communications between systems. This rule requires that you set a custom security policy for your SSL listeners. The default security policy is: Protocol-TLSv1.2,ECDHE-ECDS A-AES256-GCM-SHA384.

Control ID	Control Description	AWS Config Rule	Guidance
2726	Cryptography, Secure Shell, Automated remote access (17.5.8.C.02.)	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
3021	Cryptography, Key Management, Contents of KMPs (17.9.25.C.01.)	cmk-backing-key-rotation-enabled	Amazon Key Management Service (KMS) enables customers to rotate the backing key, which is key material stored in AWS KMS and is tied to the key ID of the CMK. It's the backing key that is used to perform cryptographic operations such as encryption and decryption. Automated key rotation currently retains all previous backing keys so that decryption of encrypted data can take place transparently. Rotating encryption keys helps reduce the potential impact of a compromised key because data encrypted with a new key can't be accessed with a previous key that might have been exposed.

Control ID	Control Description	AWS Config Rule	Guidance
3205	Network security, Network Managemen t, Limiting network access (18.1.13.C.02.)	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. The authorized Internet port list is: 443 only

Control ID	Control Description	AWS Config Rule	Guidance
3449	Product Security, Product Patching and Updating, Patching vulnerabilities in products (12.4.4.C .02.)	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule sets allowVersionUpgrade to TRUE.

Control ID	Control Description	AWS Config Rule	Guidance
3452	Product Security, Product Patching and Updating, Patching vulnerabilities in products (12.4.4.C .05.)	rds-automatic-minor-version-upgrade-enabled	This control checks whether automatic minor version upgrades are enabled for the RDS database instance. Enabling automatic minor version upgrades ensures that the latest minor version updates to the relational database management system (RDBMS) are installed . These upgrades might include security patches and bug fixes. Keeping up to date with patch installation is an important step in securing systems.

Control ID	Control Description	AWS Config Rule	Guidance
3453	Product Security, Product Patching and Updating, Patching vulnerabilities in products (12.4.4.C .06.)	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule sets allowVersionUpgrade to TRUE.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	cloudfront-associated-with-waf	This control checks whether CloudFront distributions are associated with either AWS WAF or AWS WAFv2 web ACLs. The control fails if the distribution is not associated with a web ACL. AWS WAF is a web application firewall that helps protect web applications and APIs from attacks. It allows you to configure a set of rules, called a web access control list (web ACL), that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your CloudFront distribution is associated with an AWS WAF web ACL to help protect it from malicious attacks. This rule must be applied in the us-east-1 region. Deploy with template

Control ID	Control Description	AWS Config Rule	Guidance
			parameter DeployEdgeRules = true
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	dms-replication-not-public	Manage access to the AWS Cloud by ensuring AWS Database Migration Service (DMS) replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	ec2-imdsv2-check	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within anAmazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	elasticsearch-in-vpc-only	This control checks whether Elasticsearch domains are in a virtual private cloud (VPC). It does not evaluate the VPC subnet routing configuration to determine public access. You should ensure that Elasticsearch domains are not attached to public subnets. Elasticsearch domains deployed within a VPC can communicate with VPC resources over the private AWS network, without the need to traverse the public internet. This configuration increases the security posture by limiting access to the data in transit. VPCs provide a number of network controls to secure access to Elasticsearch domains, including network ACL and security groups

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule sets ignorePublicAcls to TRUE, blockPublicPolicy to TRUE, blockPublicAcls to TRUE, and restrictPublicBuckets to TRUE.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
3562	Gateway security, Gateways, Configuration of gateways (19.1.12.C.01.)	vpc-flow-logs-enabled	The virtual private cloud (VPC) flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon VPC. By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
3623	Gateway security, Gateways, Demilitarised zones (19.1.14.C.02.)	elasticsearch-in-vpc-only	This control checks whether Elasticsearch domains are in a virtual private cloud (VPC). It does not evaluate the VPC subnet routing configuration to determine public access. You should ensure that Elasticsearch domains are not attached to public subnets. Elasticsearch domains deployed within a VPC can communicate with VPC resources over the private AWS network, without the need to traverse the public internet. This configuration increases the security posture by limiting access to the data in transit. VPCs provide a number of network controls to secure access to Elasticsearch domains, including network ACL and security groups

Control ID	Control Description	AWS Config Rule	Guidance
3623	Gateway security, Gateways, Demilitarised zones (19.1.14.C.02.)	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
3623	Gateway security, Gateways, Demilitarised zones (19.1.14.C.02.)	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3875	Network security, Intrusion Detection and Prevention, Event management and correlation (18.4.12. C.01.)	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
4441	Data management, Databases, Database files (20.4.4.C.02.)	elasticsearch-encrypted-at-rest	This control checks whether Elasticsearch domains have encryption-at-rest configuration enabled. The check fails if encryption at rest is not enabled. For an added layer of security for sensitive data, you should configure your Elasticsearch Service domain to be encrypted at rest. When you configure encryption of data at rest, Amazon Key Management Service (KMS) stores and manages your encryption keys. To perform the encryption, AWS KMS uses the Advanced Encryption Standard algorithm with 256-bit keys (AES-256).

Control ID	Control Description	AWS Config Rule	Guidance
4441	Data management, Databases, Database files (20.4.4.C.02.)	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.
4441	Data management, Databases, Database files (20.4.4.C.02.)	rds-snapshot-encry pted	Ensure that encryptio n is enabled for your Amazon Relationa l Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4441	Data management, Databases, Database files (20.4.4.C.02.)	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
4441	Data management, Databases, Database files (20.4.4.C.02.)	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4441	Data management, Databases, Database files (20.4.4.C.02.)	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule sets clusterDbEncrypted to TRUE, and loggingEnabled to TRUE.

Control ID	Control Description	AWS Config Rule	Guidance
4445	Data management, Databases, Accountability (20.4.5.C.02.)	rds-logging-enabled	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
4445	Data management, Databases, Accountability (20.4.5.C.02.)	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule sets clusterDbEncrypted to TRUE, and loggingEnabled to TRUE.

Control ID	Control Description	AWS Config Rule	Guidance
4829	Enterprise systems security, Cloud Computing, System Availability (22.1.23.C.01.)	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
4829	Enterprise systems security, Cloud Computing, System Availability (22.1.23.C.01.)	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
4838	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.03.)	cloudtrail-s3-data events-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
4838	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.03.)	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring Amazon Elastic Block Store (EBS) snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
4838	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.03.)	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule sets ignorePublicAcls to TRUE, blockPublicPolicy to TRUE, blockPublicAcls to TRUE, and restrictPublicBuckets to TRUE.

Control ID	Control Description	AWS Config Rule	Guidance
4838	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.03.)	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
4838	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.03.)	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	dynamodb-table-encrypted-kms	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned Amazon Key Management Service (KMS) key.
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	elasticsearch-encrypted-at-rest	This control checks whether Elasticsearch domains have encryption-at-rest configuration enabled. The check fails if encryption at rest is not enabled. For an added layer of security for sensitive data, you should configure your Elasticsearch Service domain to be encrypted at rest. When you configure encryption of data at rest, Amazon Key Management Service (KMS) stores and manages your encryption keys. To perform the encryption, AWS KMS uses the Advanced Encryption Standard algorithm with 256-bit keys (AES-256).

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	elasticsearch-node-to-node-encryption-check	This control checks whether Elasticsearch domains have node-to-node encryption enabled. This control fails if node-to-node encryption is disabled on the domain. HTTPS (TLS) can be used to help prevent potential attackers from eavesdropping on or manipulat ing network traffic using person-in -the-middle or similar attacks. Only encrypted connectio ns over HTTPS (TLS) should be allowed. Enabling node-to-n ode encryption for Elasticsearch domains ensures that intra-cluster communica tions are encrypted in transit.

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule sets clusterDbEncrypted to TRUE, and loggingEnabled to TRUE.
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
4839	Enterprise systems security, Cloud Computing, Unauthorised Access (22.1.24.C.04.)	secretsmanager-using-cmk	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	db-instance-backup-enabled	The backup feature of Amazon Relationa l Database Service (RDS) creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	dynamodb-pitr-enabled	Enable this rule to check that informati on has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	rds-cluster-deletion-protection-enabled	Ensure Amazon Relational Database Service (RDS) instances have deletion protection enabled. Use deletion protection to prevent your RDS instances from being accidenta lly or malicious ly deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
4849	Enterprise systems security, Cloud Computing, Backup, Recovery Archiving and Data Remanence (22.1.26.C.01.)	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB per node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
6860	Access Control and Passwords, Privileged Access Management, Monitoring and Review (16.4.35.C.02.)	cloud-trail-cloud-watch-logs-enabled	You should configure CloudTrail with CloudWatch Logs to monitor your trail logs and be notified when specific activity occurs. This rule checks whether AWS CloudTrail trails are configured to send logs to Amazon CloudWatch logs.
6860	Access Control and Passwords, Privileged Access Management, Monitoring and Review (16.4.35.C.02.)	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
6861	Access Control and Passwords, Privileged Access Management, Monitoring and Review (16.4.35. C.03.)	cloudtrail-security-trail-enabled	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10. C.01.)	dms-replication-not-public	Manage access to the AWS Cloud by ensuring AWS Database Migration Service (DMS) replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	ec2-imdsv2-check	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	elasticsearch-in-vpc-only	This control checks whether Elasticsearch domains are in a virtual private cloud (VPC). It does not evaluate the VPC subnet routing configuration to determine public access. You should ensure that Elasticsearch domains are not attached to public subnets. Elasticsearch domains deployed within a VPC can communicate with VPC resources over the private AWS network, without the need to traverse the public internet. This configuration increases the security posture by limiting access to the data in transit. VPCs provide a number of network controls to secure access to Elasticsearch domains, including network ACL and security groups

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule sets ignorePublicAcls to TRUE, blockPublicPolicy to TRUE, blockPublicAcls to TRUE, and restrictPublicBuckets to TRUE.
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
7466	Public Cloud Security, Data Protection in Public Cloud, Data accessibility (23.4.10.C.01.)	vpc-flow-logs-enabled	The virtual private cloud (VPC) flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon VPC. By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requirements (23.5.11.C.01.)	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requirements (23.5.11.C.01.)	cloudfront-accesslogs-enabled	This control checks whether server access logging is enabled on CloudFront distributions. The control fails if access logging is not enabled for a distribution. CloudFront access logs provide detailed information about every user request that CloudFront receives. Each log contains information such as the date and time the request was received, the IP address of the viewer that made the request, the source of the request, and the port number of the request from the viewer. These logs are useful for applications such as security and access audits and forensics investigation. This rule must be applied in the us-east-1 region.

Control ID	Control Description	AWS Config Rule	Guidance
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requirements (23.5.11.C.01.)	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requirements (23.5.11.C.01.)	cloudwatch-log-group-encrypted	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requirements (23.5.11.C.01.)	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
7496	Public Cloud Security, Logging and Alerting in Public Cloud, Logging requireme nts (23.5.11.C.01.)	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.
7545	Access Control and Passwords, Identific ation, Authentication and Authentication, Passwords and policy (16.1.31.C.02.)	iam-password-policy	Annual password changes are required on systems that have not implement ed multi-factor authentication (MFA) or passwordl ess authentic ation. Because this conformance pack contains the iam-user-mfa-enabled Config Rule, this control ensures password changes every three years.

Control ID	Control Description	AWS Config Rule	Guidance
7546	Access Control and Passwords, Identification, Authentication and Authentication, Passwords and policy (16.1.31.C.03.)	iam-password-policy	Ensure a minimum password length of 16 characters (e.g four words). Passwords must be long, strong and unique. No explicit complexity requirements are enforced (e.g. numbers or special characters), however passwords must be unique, or random and may include special characters and numbers to achieve this.

Operational Best Practices for PCI DSS 3.2.1

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Payment Card Industry Data Security Standard (PCI DSS) 3.2.1 and AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more PCI DSS controls. A PCI DSS control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	alb-desync-mode-check	To assist in protecting applications for HTTP Desync vulnerabilities, ensure HTTP Desync mitigation mode is enabled on your application load balancers. HTTP Desync issues can lead to request smuggling and make your applications vulnerable to request queue or cache poisoning. Desync mitigation modes are monitor, defensive, and strictest. Defensive is the default mode.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	alb-http-drop-invalid-header-enabled	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
1.3	Prohibit direct public access between the Internet and any	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2)

Control ID	Control Description	AWS Config Rule	Guidance
	system component in the cardholder data environment.		Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associate d resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessibl e, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	netfw-stateless-rule-group-not-empty	An AWS Network Firewall rule group contains rules that define how your firewall processes traffic in your VPC. An empty stateless rule group when present in a firewall policy does not process traffic.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	s3-bucket-level-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholde r data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
1.3.6	Place system components that store cardholde r data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	netfw-policy-rule-group-associated	An AWS Network Firewall policy defines how your firewall monitors and handles traffic in an Amazon VPC. You configure stateless and stateful rule groups to filter packets and traffic flows, and you define default traffic handling.
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	netfw-stateless-rule-group-not-empty	An AWS Network Firewall rule group contains rules that define how your firewall processes traffic in your VPC. An empty stateless rule group when present in a firewall policy does not process traffic.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholde r data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
1.3.6	Place system components that store cardholde r data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholde r data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

The management of access should be consistent with the classification of the data.
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.6	Place system components that store cardholder data (such as a database) in an internal network zone, segregated from the DMZ and other untrusted networks.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
2.1	Always change vendor-supplied defaults and remove or disable unnecessary default accounts before installing a system on the network. This applies to ALL default passwords, including but not limited to those used by operating systems, software that provides security services, application and system accounts, point-of-sale (POS) terminals, payment applications, Simple Network Management Protocol (SNMP) community strings, etc.).	rds-cluster-default-admin-check	As default usernames are public knowledge, changing default usernames can assist in reducing the attack surface for your Amazon Relational Database Service (Amazon RDS) database cluster(s).

Control ID	Control Description	AWS Config Rule	Guidance
2.1	Always change vendor-supplied defaults and remove or disable unnecessary default accounts before installing a system on the network. This applies to ALL default passwords, including but not limited to those used by operating systems, software that provides security services, application and system accounts, point-of-sale (POS) terminals, payment applications, Simple Network Management Protocol (SNMP) community strings, etc.).	rds-instance-default-admin-check	As default usernames are public knowledge, changing default usernames can assist in reducing the attack surface for your Amazon Relational Database Service (Amazon RDS) database instance(s).

Control ID	Control Description	AWS Config Rule	Guidance
2.1	Always change vendor-supplied defaults and remove or disable unnecessary default accounts before installing a system on the network. This applies to ALL default passwords, including but not limited to those used by operating systems, software that provides security services, application and system accounts, point-of-sale (POS) terminals, payment applications, Simple Network Management Protocol (SNMP) community strings, etc.).	redshift-default-admin-check	As default usernames are public knowledge, changing default usernames can assist in reducing the attack surface for your Amazon Redshift cluster(s).

Control ID	Control Description	AWS Config Rule	Guidance
2.1	Always change vendor-supplied defaults and remove or disable unnecessary default accounts before installing a system on the network. This applies to ALL default passwords, including but not limited to those used by operating systems, software that provides security services, application and system accounts, point-of-sale (POS) terminals, payment applications, Simple Network Management Protocol (SNMP) community strings, etc.).	redshift-default-db-name-check	Default names are public knowledge and should be changed upon configuration. Changing the default database name of your Amazon Redshift cluster can assist in reducing the attack surface for your Redshift cluster.

Control ID	Control Description	AWS Config Rule	Guidance
2.1	Always change vendor-supplied defaults and remove or disable unnecessary default accounts before installing a system on the network. This applies to ALL default passwords, including but not limited to those used by operating systems, software that provides security services, application and system accounts, point-of-sale (POS) terminals, payment applications, Simple Network Management Protocol (SNMP) community strings, etc.).	root-account-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
2.1	Always change vendor-supplied defaults and remove or disable unnecessary default accounts before installing a system on the network. This applies to ALL default passwords, including but not limited to those used by operating systems, software that provides security services, application and system accounts, point-of-sale (POS) terminals, payment applications, Simple Network Management Protocol (SNMP) community strings, etc.).	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	access-keys-rotated	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	account-part-of-organizations	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	cmk-backing-key-rotation-enabled	Enable key rotation to ensure that keys are rotated after they have reached the end of their crypto period.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	ec2-instance-multiple-eni-check	This rule checks if your Amazon Elastic Compute Cloud (Amazon EC2) instances have multiple ENIs. Having multiple ENIs can cause dual-homed instances, meaning instances that have multiple subnets. This can add network security complexity and introduce unintended network paths and access.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: ,Ä¢ Center for Internet Security (CIS) ,Ä¢ International Organization for Standardization (ISO) ,Ä¢ SysAdmin Audit Network Security (SANS) Institute ,Ä¢ National Institute of Standards Technology (NIST).	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	ec2-security-group-attached-to-eni-periodic	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	iam-user-group-membership-check	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configura tion standards for all system component s. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technolog y (NIST).	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	root-account-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: ,Ä¢ Center for Internet Security (CIS) ,Ä¢ International Organization for Standardization (ISO) ,Ä¢ SysAdmin Audit Network Security (SANS) Institute ,Ä¢ National Institute of Standards Technology (NIST).	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
2.2	Develop configuration standards for all system components. Assure that these standards address all known security vulnerabilities and are consistent with industry-accepted system hardening standards. Sources of industry-accepted system hardening standards may include, but are not limited to: • Center for Internet Security (CIS) • International Organization for Standardization (ISO) • SysAdmin Audit Network Security (SANS) Institute • National Institute of Standards Technology (NIST).	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associate d resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessibl e, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	s3-bucket-level-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level.
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.3	Implement additional security features for any required services, protocols, or daemons that are considered to be insecure.	alb-desync-mode-check	To assist in protecting applications for HTTP Desync vulnerabilities, ensure HTTP Desync mitigation mode is enabled on your application load balancers. HTTP Desync issues can lead to request smuggling and make your applications vulnerable to request queue or cache poisoning. Desync mitigation modes are monitor, defensive, and strictest. Defensive is the default mode.
2.3	Encrypt all non-console administrative access using strong cryptography.	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
2.3	Encrypt all non-conso le administrative access using strong cryptography.	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configure d with SSL certifica tes to allow backend systems to authentic ate that requests originate from API Gateway.
2.3	Encrypt all non-conso le administrative access using strong cryptography.	elb-tls-https-list eners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.
2.3	Encrypt all non-conso le administrative access using strong cryptography.	opensearch-https-r equired	Because sensitive data can exist and to help protect data in transit, ensure HTTPS is enabled for connections to your Amazon OpenSearch Service domains.

Control ID	Control Description	AWS Config Rule	Guidance
2.3	Encrypt all non-conso le administrative access using strong cryptography.	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryptio n to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
2.4	Maintain an inventory of system component s that are in scope for PCI DSS.	ec2-security-group-attached-to-eni-periodic	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	Control Description	AWS Config Rule	Guidance
2.4	Maintain an inventory of system component s that are in scope for PCI DSS.	eip-attached	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.

Control ID	Control Description	AWS Config Rule	Guidance
2.4	Maintain an inventory of system components that are in scope for PCI DSS.	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
2.4	Maintain an inventory of system components that are in scope for PCI DSS.	vpc-network-acl-unused-check	This rule ensures that Amazon Virtual Private Cloud (VPC) network access control lists are in use. Monitoring for unused network access control lists can assist in accurate inventory and management of your environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.1	Keep cardholder data storage to a minimum by implementing data retention and disposal policies, procedures and processes that include at least the following for all cardholder data (CHD) storage: • Limiting data storage amount and retention time to that which is required for legal, regulatory, and/or business requirements • Specific retention requirements for cardholder data • Processes for secure deletion of data when no longer needed • A quarterly process for identifying and securely deleting stored cardholder data that exceeds defined retention.	s3-lifecycle-policy-check	Ensure Amazon S3 lifecycle policies are configured to help define actions that you want Amazon S3 to take during an object's lifetime (for example, transition objects to another storage class, archive them, or delete them after a specified period of time).

Control ID	Control Description	AWS Config Rule	Guidance
3.1	Keep cardholder data storage to a minimum by implementing data retention and disposal policies, procedures and processes that include at least the following for all cardholder data (CHD) storage: • Limiting data storage amount and retention time to that which is required for legal, regulatory, and/or business requirements • Specific retention requirements for cardholder data • Processes for secure deletion of data when no longer needed • A quarterly process for identifying and securely deleting stored cardholder data that exceeds defined retention.	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
3.1	Keep cardholder data storage to a minimum by implementing data retention and disposal policies, procedures and processes that include at least the following for all cardholder data (CHD) storage: • Limiting data storage amount and retention time to that which is required for legal, regulatory, and/or business requirements • Specific retention requirements for cardholder data • Processes for secure deletion of data when no longer needed • A quarterly process for identifying and securely deleting stored cardholder data that exceeds defined retention.	backup-recovery-point-minimum-retention-check	To help with data back-up processes, ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredRetentionDays (config default: 35) parameter. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
3.1	Keep cardholder data storage to a minimum by implementing data retention and disposal policies, procedures and processes that include at least the following for all cardholder data (CHD) storage: • Limiting data storage amount and retention time to that which is required for legal, regulatory, and/or business requirements • Specific retention requirements for cardholder data • Processes for secure deletion of data when no longer needed • A quarterly process for identifying and securely deleting stored cardholder data that exceeds defined retention.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored (including on portable digital media, backup media, and in logs) by using any of the following approaches: • One-way hashes based on strong cryptography, (hash must be of the entire PAN) • Truncation (hashing cannot be used to replace the truncated segment of PAN) • Index tokens and pads (pads must be securely stored) • Strong cryptography with associated key-management processes and procedures. Note: It is a relatively trivial effort for a malicious individual to reconstruct original PAN data if they have access to both the truncated and hashed version of a PAN. Where hashed and truncated	backup-recovery-point-encrypted	Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
	versions of the same PAN are present in an entity's environment, additional controls must be in place to ensure that the hashed and truncated versions cannot be correlated to reconstruct the original PAN.		

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored (including on portable digital media, backup media, and in logs) by using any of the following approaches: • One-way hashes based on strong cryptography, (hash must be of the entire PAN) • Truncation (hashing cannot be used to replace the truncated segment of PAN) • Index tokens and pads (pads must be securely stored) • Strong cryptography with associated key-management processes and procedures. Note: It is a relatively trivial effort for a malicious individual to reconstruct original PAN data if they have access to both the truncated and hashed version of a PAN. Where hashed and truncated	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
	versions of the same PAN are present in an entity's environment, additional controls must be in place to ensure that the hashed and truncated versions cannot be correlated to reconstruct the original PAN.		

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored (including on portable digital media, backup media, and in logs) by using any of the following approaches: • One-way hashes based on strong cryptography, (hash must be of the entire PAN) • Truncation (hashing cannot be used to replace the truncated segment of PAN) • Index tokens and pads (pads must be securely stored) • Strong cryptography with associated key-management processes and procedures. Note: It is a relatively trivial effort for a malicious individual to reconstruct original PAN data if they have access to both the truncated and hashed version of a PAN. Where hashed and truncated	cloudwatch-log-group-encrypted	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
	versions of the same PAN are present in an entity's environment, additional controls must be in place to ensure that the hashed and truncated versions cannot be correlated to reconstruct the original PAN.		

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored (includin g on portable digital media, backup media, and in logs) by using any of the following approaches: • One-way hashes based on strong cryptogra phy, (hash must be of the entire PAN) • Truncation (hashing cannot be used to replace the truncated segment of PAN) • Index tokens and pads (pads must be securely stored) • Strong cryptogra phy with associate d key-management processes and procedures. Note: It is a relatively trivial effort for a malicious individua l to reconstruct original PAN data if they have access to both the truncated and hashed version of a PAN. Where hashed and truncated	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
	versions of the same PAN are present in an entity's environment, additional controls must be in place to ensure that the hashed and truncated versions cannot be correlated to reconstruct the original PAN.		

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored (includin g on portable digital media, backup media, and in logs) by using any of the following approaches: • One-way hashes based on strong cryptogra phy, (hash must be of the entire PAN) • Truncation (hashing cannot be used to replace the truncated segment of PAN) • Index tokens and pads (pads must be securely stored) • Strong cryptogra phy with associate d key-management processes and procedures. Note: It is a relatively trivial effort for a malicious individua l to reconstruct original PAN data if they have access to both the truncated and hashed version of a PAN. Where hashed and truncated	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryptio n is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
	versions of the same PAN are present in an entity's environment, additional controls must be in place to ensure that the hashed and truncated versions cannot be correlated to reconstruct the original PAN.		

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored (includin g on portable digital media, backup media, and in logs) by using any of the following approaches: • One-way hashes based on strong cryptogra phy, (hash must be of the entire PAN) • Truncation (hashing cannot be used to replace the truncated segment of PAN) • Index tokens and pads (pads must be securely stored) • Strong cryptogra phy with associate d key-management processes and procedures. Note: It is a relatively trivial effort for a malicious individua l to reconstruct original PAN data if they have access to both the truncated and hashed version of a PAN. Where hashed and truncated	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryptio n is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
	versions of the same PAN are present in an entity's environment, additional controls must be in place to ensure that the hashed and truncated versions cannot be correlated to reconstruct the original PAN.		

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored (including on portable digital media, backup media, and in logs) by using any of the following approaches: • One-way hashes based on strong cryptography, (hash must be of the entire PAN) • Truncation (hashing cannot be used to replace the truncated segment of PAN) • Index tokens and pads (pads must be securely stored) • Strong cryptography with associated key-management processes and procedures. Note: It is a relatively trivial effort for a malicious individual to reconstruct original PAN data if they have access to both the truncated and hashed version of a PAN. Where hashed and truncated	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
	versions of the same PAN are present in an entity's environment, additional controls must be in place to ensure that the hashed and truncated versions cannot be correlated to reconstruct the original PAN.		

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored (including on portable digital media, backup media, and in logs) by using any of the following approaches: • One-way hashes based on strong cryptography, (hash must be of the entire PAN) • Truncation (hashing cannot be used to replace the truncated segment of PAN) • Index tokens and pads (pads must be securely stored) • Strong cryptography with associated key-management processes and procedures. Note: It is a relatively trivial effort for a malicious individual to reconstruct original PAN data if they have access to both the truncated and hashed version of a PAN. Where hashed and truncated	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
	versions of the same PAN are present in an entity's environment, additional controls must be in place to ensure that the hashed and truncated versions cannot be correlated to reconstruct the original PAN.		

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored (including on portable digital media, backup media, and in logs) by using any of the following approaches: • One-way hashes based on strong cryptography, (hash must be of the entire PAN) • Truncation (hashing cannot be used to replace the truncated segment of PAN) • Index tokens and pads (pads must be securely stored) • Strong cryptography with associated key-management processes and procedures. Note: It is a relatively trivial effort for a malicious individual to reconstruct original PAN data if they have access to both the truncated and hashed version of a PAN. Where hashed and truncated	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
	versions of the same PAN are present in an entity's environment, additional controls must be in place to ensure that the hashed and truncated versions cannot be correlated to reconstruct the original PAN.		

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored (including on portable digital media, backup media, and in logs) by using any of the following approaches: • One-way hashes based on strong cryptography, (hash must be of the entire PAN) • Truncation (hashing cannot be used to replace the truncated segment of PAN) • Index tokens and pads (pads must be securely stored) • Strong cryptography with associated key-management processes and procedures. Note: It is a relatively trivial effort for a malicious individual to reconstruct original PAN data if they have access to both the truncated and hashed version of a PAN. Where hashed and truncated	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
	versions of the same PAN are present in an entity's environment, additional controls must be in place to ensure that the hashed and truncated versions cannot be correlated to reconstruct the original PAN.

Where hashed and truncated	sns-encrypted-kms	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
	versions of the same PAN are present in an entity's environment, additional controls must be in place to ensure that the hashed and truncated versions cannot be correlated to reconstruct the original PAN.		

Control ID	Control Description	AWS Config Rule	Guidance
3.5.2	Restrict access to cryptographic keys to the fewest number of custodians necessary.	iam-customer-policy-blocked-kms-actions	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies

Control ID	Control Description	AWS Config Rule	Guidance
3.5.2	Restrict access to cryptographic keys to the fewest number of custodians necessary.	iam-inline-policy-blocked-kms-actions	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Managemen t Service keys. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegatin g permissions management. This rule allows you to set the blockedAc tionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.3	Store secret and private keys used to encrypt/decrypt cardholder data in one (or more) of the following forms at all times: • Encrypted with a key-encrypting key that is at least as strong as the data- encrypting key, and that is stored separately from the data-encrypting key • Within a secure cryptographic device (such as a hardware (host) security module (HSM) or PTS-approved point-of-interaction device) • As at least two full-length key components or key shares, in accordance with an industry- accepted method Note: It is not required that public keys be stored in one of these forms.	s3-default-encryption-kms	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.3	Store secret and private keys used to encrypt/decrypt cardholder data in one (or more) of the following forms at all times: • Encrypted with a key-encrypting key that is at least as strong as the data- encrypting key, and that is stored separately from the data-encrypting key • Within a secure cryptographic device (such as a hardware (host) security module (HSM) or PTS-approved point-of-interaction device) • As at least two full-length key components or key shares, in accordance with an industry- accepted method Note: It is not required that public keys be stored in one of these forms.	sagemaker-endpoint-configuration-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.3	Store secret and private keys used to encrypt/decrypt cardholder data in one (or more) of the following forms at all times: • Encrypted with a key-encrypting key that is at least as strong as the data- encrypting key, and that is stored separately from the data-encrypting key • Within a secure cryptographic device (such as a hardware (host) security module (HSM) or PTS-approved point-of-interaction device) • As at least two full-length key components or key shares, in accordance with an industry- accepted method Note: It is not required that public keys be stored in one of these forms.	sagemaker-notebook-instance-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.4	Cryptographic key changes for keys that have reached the end of their cryptoperiod (for example, after a defined period of time has passed and/or after a certain amount of cipher-text has been produced by a given key), as defined by the associated application vendor or key owner, and based on industry best practices and guidelines (for example, NIST Special Publication 800-57).	cmk-backing-key-rotation-enabled	Enable key rotation to ensure that keys are rotated after they have reached the end of their crypto period.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.5	Retirement or replacement (for example, archiving, destruction, and/or revocation) of keys as deemed necessary when the integrity of the key has been weakened (for example, departure of an employee with knowledge of a clear-text key component), or keys are suspected of being compromised. Note: If retired or replaced cryptographic keys need to be retained, these keys must be securely archived (for example, by using a key-encryption key). Archived cryptographic keys should only be used for decryption/verification purposes.	kms-cmk-not-scheduled-for-deletion	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.7	Prevention of unauthorized substitution of cryptographic keys.	kms-cmk-not-scheduled-for-deletion	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.

Control ID	Control Description	AWS Config Rule	Guidance
4.1	Use strong cryptography and security protocols to safeguard sensitive cardholder data during transmission over open, public networks, including the following: • Only trusted keys and certificates are accepted. • The protocol in use only supports secure versions or configurations. • The encryption strength is appropriate for the encryption methodology in use. Examples of open, public networks include but are not limited to: • The Internet • Wireless technologies, including 802.11 and Bluetooth • Cellular technologies, for example, Global System for Mobile communications (GSM), Code division multiple access	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
	(CDMA) • General Packet Radio Service (GPRS) • Satellite communications		

Control ID	Control Description	AWS Config Rule	Guidance
4.1	Use strong cryptogra phy and security protocols to safeguard sensitive cardholder data during transmission over open, public networks, including the following: • Only trusted keys and certificates are accepted. • The protocol in use only supports secure versions or configurations. • The encryption strength is appropria te for the encryptio n methodology in use. Examples of open, public networks include but are not limited to: • The Internet • Wireless technolog ies, including 802.11 and Bluetooth • Cellular technologies, for example, Global System for Mobile communications (GSM), Code division multiple access	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Applicati on Load Balancer automatically redirects unencrypt ed HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

6.2	Ensure that all system component s and software are protected from known vulnerabilities by installing applicabl e vendor- supplied security patches. Install critical security patches within one month of release. Note: Critical security patches should be identified according to the risk ranking process defined in Requirement 6.1.	elastic-beanstalk-managed-updates-enabled	Enabling managed platform updates for an Amazon Elastic Beanstalk environme nt ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems.

Control ID	Control Description	AWS Config Rule	Guidance
6.2	Ensure that all system components and software are protected from known vulnerabilities by installing applicable vendor- supplied security patches. Install critical security patches within one month of release. Note: Critical security patches should be identified according to the risk ranking process defined in Requirement 6.1.	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
6.2	Ensure that all system component s and software are protected from known vulnerabilities by installing applicabl e vendor- supplied security patches. Install critical security patches within one month of release. Note: Critical security patches should be identified according to the risk ranking process defined in Requirement 6.1.	ec2-managedinstanc e-patch-compliance-status-check	Enable this rule to help with identific ation and documenta tion of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch complianc e in AWS Systems Manager as required by your organizat ion's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
6.2	Ensure that all system component s and software are protected from known vulnerabilities by installing applicabl e vendor- supplied security patches. Install critical security patches within one month of release. Note: Critical security patches should be identified according to the risk ranking process defined in Requirement 6.1.	ecs-fargate-latest-platform-version	Security updates and patches are deployed automatic ally for your AWS Fargate tasks. If a security issue is found that affects an AWS Fargate platform version, AWS patches the platform version. To assist in patch management of your Amazon Elastic Container Service (ECS) tasks running AWS Fargate, update your services standalone tasks to use the most recent platform version.

Control ID	Control Description	AWS Config Rule	Guidance
6.2	Ensure that all system component s and software are protected from known vulnerabilities by installing applicabl e vendor- supplied security patches. Install critical security patches within one month of release. Note: Critical security patches should be identified according to the risk ranking process defined in Requirement 6.1.	rds-automatic-mino r-version-upgrade- enabled	Enable automatic minor version upgrades on your Amazon Relationa l Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed , which may include security patches and bug fixes.

Control ID	Control Description	AWS Config Rule	Guidance
6.2	Ensure that all system component s and software are protected from known vulnerabilities by installing applicabl e vendor- supplied security patches. Install critical security patches within one month of release. Note: Critical security patches should be identified according to the risk ranking process defined in Requirement 6.1.	redshift-cluster-m aintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organizat ion. Specifically, that they have preferred maintenan ce windows and automated snapshot retention periods for the database. This rule requires you to set the allowVers ionUpgrade. The default is true. It also lets you optionall y set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionP eriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
6.3.2	Review custom code prior to release to production or customers in order to identify any potential coding vulnerability (using either manual or automated processes) to include at least the following: • Code changes are reviewed by individuals other than the originating code author, and by individuals knowledgeable about code-review techniques and secure coding practices. • Code reviews ensure code is developed according to secure coding guidelines • Appropriate corrections are implemented prior to release. • Code-review results are reviewed and approved by management prior to release. (Continued on next page)	ecr-private-image-scanning-enabled	Amazon Elastic Container Repository (ECR) image scanning assists in identifying software vulnerabilities in your container images. Enabling image scanning on ECR repositories adds a layer of verification for the integrity and safety of the images being stored.

Control ID	Control Description	AWS Config Rule	Guidance
6.6	For public-facing web applications, address new threats and vulnerabilities on an ongoing basis and ensure these applications are protected against known attacks by either of the following methods: • Reviewing public-facing web applications from manual or automated application vulnerability security assessment tools or methods, at least annually and after any changes Note: This assessment is not the same as the vulnerability scans performed for Requirement 11.2. • Installing an automated technical solution that detects and prevents web-based attacks (for example, a web-application firewall) in front of public-facing web applicati	alb-desync-mode-check	To assist in protecting applications for HTTP Desync vulnerabilities, ensure HTTP Desync mitigation mode is enabled on your application load balancers. HTTP Desync issues can lead to request smuggling and make your applications vulnerable to request queue or cache poisoning. Desync mitigation modes are monitor, defensive, and strictest. Defensive is the default mode.

This rule allows you to set the blockedAc tionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Establish an access control system(s) for systems component s that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following : Coverage of all system components	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Coverage of all system components	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Coverage of all system components	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
7.2.1	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Coverage of all system components	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Coverage of all system components	iam-user-group-membership-check	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
7.2.1	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Coverage of all system components	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Coverage of all system components	opensearch-access-control-enabled	Ensure fine-grained access control is enabled on your Amazon OpenSearch Service domains. Fine-grained access control provides enhanced authorization mechanisms to achieve least-privileged access to Amazon OpenSearch Service domains. It allows for role-based access control to the domain, as well as index, document, and field-level security, support for OpenSearch Service dashboards multi-tenancy, and HTTP basic authentication for OpenSearch Service and Kibana.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Assignment of privileges to individuals based on job classification and function.	ecs-containers-nonprivileged	To assist with implementing the principle of least privilege, Amazon Elastic Container Service (Amazon ECS) task definitions should not have elevated privilege enabled. When this parameter is true, the container is given elevated privileges on the host container instance (similar to the root user).
7.2.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Assignment of privileges to individuals based on job classification and function.	ecs-containers-readonly-access	Enabling read only access to Amazon Elastic Container Service (ECS) containers can assist in adhering to the principal of least privilege. This option can reduces attack vectors as the container instance's filesystem cannot be modified unless it has explicit read-write permissions.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Assignment of privileges to individuals based on job classification and function.	efs-access-point-enforce-root-directory	Enforcing a root directory for an Amazon Elastic File System (Amazon EFS) access point helps restrict data access by ensuring that users of the access point can only reach files of the specified subdirectory.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Assignment of privileges to individuals based on job classification and function.	efs-access-point-enforce-user-identity	To assist with implementing the principle of least privilege, ensure user enforcement is enabled for your Amazon Elastic File System (Amazon EFS) .When enabled, Amazon EFS replaces the NFS client's user and group IDs with the identity configured on the access point for all file system operations and only grants access to this enforced user identity.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Assignment of privileges to individuals based on job classification and function.	emr-kerberos-enabled	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Establish an access control system(s) for systems component s that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Assignmen t of privileges to individuals based on job classification and function.	iam-customer-policy-blocked-kms-actions	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Establish an access control system(s) for systems component s that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Assignmen t of privileges to individuals based on job classification and function.	iam-group-has-users-check	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissio ns or job function is one way to incorpora te least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Establish an access control system(s) for systems component s that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Assignmen t of privileges to individuals based on job classification and function.	iam-inline-policy-blocked-kms-actions	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Managemen t Service keys. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegatin g permissions management. This rule allows you to set the blockedAc tionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Establish an access control system(s) for systems component s that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
7.2.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Assignment of privileges to individuals based on job classification and function.	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed. This access control system(s) must include the following: Assignment of privileges to individuals based on job classification and function.	opensearch-access-control-enabled	Ensure fine-grained access control is enabled on your Amazon OpenSearch Service domains. Fine-grained access control provides enhanced authorization mechanisms to achieve least-privileged access to Amazon OpenSearch Service domains. It allows for role-based access control to the domain, as well as index, document, and field-level security, support for OpenSearch Service dashboards multi-tenancy, and HTTP basic authentication for OpenSearch Service and Kibana.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.3	Default “deny-all” setting.	s3-bucket-acl-prohibited	This rule checks to see if Access Control Lists (ACLs) are used to for access control on Amazon S3 Buckets. ACLs are legacy access control mechanisms for Amazon S3 buckets that predate AWS Identity and Access Management (IAM). Instead of ACLs, it is a best practice to use IAM policies or S3 bucket policies to more easily manage access to your S3 buckets.

Control ID	Control Description	AWS Config Rule	Guidance
8.1.1	Assign all users a unique ID before allowing them to access system components or cardholder data.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
8.1.4	Remove/disable inactive user accounts within 90 days.	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	codebuild-project-environment-privileged-check	To assist with implementing the principle of least privilege, ensure your Amazon CodeBuild project environment does not have privileged mode enabled. This setting should be disabled to prevent unintended access to Docker APIs as well as the container's underlying hardware.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	ecs-no-environment-secrets	As a security best practice, pass sensitive informati on to container s as environme nt variables. You can securely inject data into your Amazon Elastic Container Service (ECS) container s by referencing values stored in AWS Systems Manager Parameter Store or AWS Secrets Manager in the container definition of an Amazon ECS task definition. Then, you can expose your sensitive informati on as environment variables or in the log configuration of a container.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Applicati on Load Balancer automatically redirects unencrypt ed HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configure d with SSL certifica tes to allow backend systems to authentic ate that requests originate from API Gateway.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryptio n is enabled for your Amazon Elastic File System (EFS).
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	elasticsearch-encr ypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryptio n is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	opensearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	s3-default-encryption-kms	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	sagemaker-endpoint-configuration-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	sagemaker-notebook-instance-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	secretsmanager-using-cmk	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	sns-encrypted-kms	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.3	Passwords/passphrases must meet the following: • Require a minimum length of at least seven characters. • Contain both numeric and alphabetic characters. Alternatively, the passwords/passphrases must have complexity and strength at least equivalent to the parameters specified above.	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCharacters (PCI DSS default: false), RequireLowercaseCharacters (PCI DSS default: true), RequireSymbols (PCI DSS default: false), RequireNumbers (PCI DSS default: true), MinimumPasswordLength (PCI DSS default: 7), PasswordReusePrevention (PCI DSS default: 4), and MaxPasswordAge (PCI DSS default: 90) for

Control ID	Control Description	AWS Config Rule	Guidance
			your IAM Password Policy. The actual values should reflect your organization's policies.
8.2.4	Change user passwords/passphrases at least after every 90 days.	access-keys-rotated	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.4	Change user passwords/passphrases at least after every 90 days.	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCharacters (PCI DSS default: false), RequireLowercaseCharacters (PCI DSS default: true), RequireSymbols (PCI DSS default: false), RequireNumbers (PCI DSS default: true), MinimumPasswordLength (PCI DSS default: 7), PasswordReusePrevention (PCI DSS default: 4), and MaxPasswordAge (PCI DSS default: 90) for

Control ID	Control Description	AWS Config Rule	Guidance
			your IAM Password Policy. The actual values should reflect your organization's policies.
8.2.4	Change user passwords/passphrases at least after every 90 days.	secretsmanager-rotation-enabled-check	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.5	Do not allow an individual to submit a new password/passphrase that is the same as any of the last four passwords/passphrases he or she has used.	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (PCI DSS default: false), RequireLowercaseCh aracters (PCI DSS default: true), RequireSymbols (PCI DSS default: false), RequireNumbers (PCI DSS default: true), MinimumPa sswordLength (PCI DSS default: 7), PasswordReusePreve ntion (PCI DSS default: 4), and MaxPasswordAge (PCI DSS default: 90) for

Control ID	Control Description	AWS Config Rule	Guidance
			your IAM Password Policy. The actual values should reflect your organization's policies.
8.3.1	Incorporate multi-factor authentication for all non-console access into the CDE for personnel with administrative access.	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.1	Incorporate multi-factor authentication for all non-console access into the CDE for personnel with administrative access.	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protectio n on top of a user name and password. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.1	Incorporate multi-factor authentication for all non-console access into the CDE for personnel with administrative access.	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.1	Incorporate multi-factor authentication for all non-console access into the CDE for personnel with administrative access.	root-account-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
8.3.2	Incorporate multi-factor authentication for all remote network access (both user and administrator, and including third-party access for support or maintenance) originating from outside the entity's network.	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Incorporate multi-factor authentic ation for all remote network access (both user and administr ator, and including third-party access for support or maintenan ce) originating from outside the entity's network.	mfa-enabled-for-ia m-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protectio n on top of a user name and password. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Incorporate multi-factor authentic ation for all remote network access (both user and administr ator, and including third-party access for support or maintenan ce) originating from outside the entity's network.	root-account-hardw are-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privilege d user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Incorporate multi-factor authentic ation for all remote network access (both user and administr ator, and including third-party access for support or maintenan ce) originating from outside the entity's network.	root-account-mfa-e nabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
10.1	Implement audit trails to link all access to system component s to each individual user.	api-gw-execution-l ogging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
10.1	Implement audit trails to link all access to system components to each individual user.	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
10.1	Implement audit trails to link all access to system components to each individual user.	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
10.1	Implement audit trails to link all access to system component s to each individual user.	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
10.1	Implement audit trails to link all access to system components to each individual user.	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
10.1	Implement audit trails to link all access to system components to each individual user.	wafv2-logging-enabled	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
10.1	Implement audit trails to link all access to system components to each individual user.	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
10.1	Implement audit trails to link all access to system components to each individual user.	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
10.1	Implement audit trails to link all access to system component s to each individual user.	codebuild-project-logging-enabled	Ensure AWS CodeBuild project logging is enabled so that your build output logs are sent to either Amazon CloudWatch or Amazon Simple Storage Service (Amazon S3). Build output logs provide detailed informati on about your build project.
10.1	Implement audit trails to link all access to system component s to each individual user.	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
10.1	Implement audit trails to link all access to system components to each individual user.	opensearch-audit-logging-enabled	Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries.
10.1	Implement audit trails to link all access to system components to each individual user.	opensearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
10.1	Implement audit trails to link all access to system components to each individual user.	rds-logging-enabled	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
10.1	Implement audit trails to link all access to system components to each individual user.	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Implement automated audit trails for all system components to reconstruct the following events: All individual user accesses to cardholder data	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Implement automated audit trails for all system components to reconstruct the following events: All individual user accesses to cardholder data	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Implement automated audit trails for all system components to reconstruct the following events: All individual user accesses to cardholder data	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Implement automated audit trails for all system components to reconstruct the following events: All individual user accesses to cardholder data	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
10.2.1	Implement automated audit trails for all system components to reconstruct the following events: All individual user accesses to cardholder data	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Implement automated audit trails for all system components to reconstruct the following events: All individual user accesses to cardholder data	codebuild-project-logging-enabled	Ensure AWS CodeBuild project logging is enabled so that your build output logs are sent to either Amazon CloudWatch or Amazon Simple Storage Service (Amazon S3). Build output logs provide detailed information about your build project.
10.2.1	Implement automated audit trails for all system components to reconstruct the following events: All individual user accesses to cardholder data	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Implement automated audit trails for all system components to reconstruct the following events: All individual user accesses to cardholder data	opensearch-audit-logging-enabled	Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries.

10.2.7	Implement automated audit trails for all system components to reconstruct the following events: Creation and deletion of system- level objects	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.7	Implement automated audit trails for all system components to reconstruct the following events: Creation and deletion of system- level objects	opensearch-audit-logging-enabled	Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries.
10.2.7	Implement automated audit trails for all system components to reconstruct the following events: Creation and deletion of system- level objects	opensearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.7	Implement automated audit trails for all system components to reconstruct the following events: Creation and deletion of system- level objects	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.
10.3.1	Record at least the following audit trail entries for all system components for each event: User identific ation	api-gw-execution-l ogging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Record at least the following audit trail entries for all system components for each event: User identification	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Record at least the following audit trail entries for all system components for each event: User identification	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Record at least the following audit trail entries for all system components for each event: User identific ation	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Record at least the following audit trail entries for all system components for each event: User identification	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Record at least the following audit trail entries for all system components for each event: User identification	wafv2-logging-enabled	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Record at least the following audit trail entries for all system components for each event: User identification	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
10.3.1	Record at least the following audit trail entries for all system components for each event: User identification	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Record at least the following audit trail entries for all system components for each event: User identific ation	codebuild-project-logging-enabled	Ensure AWS CodeBuild project logging is enabled so that your build output logs are sent to either Amazon CloudWatch or Amazon Simple Storage Service (Amazon S3). Build output logs provide detailed informati on about your build project.
10.3.1	Record at least the following audit trail entries for all system components for each event: User identific ation	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Record at least the following audit trail entries for all system components for each event: User identification	opensearch-audit-logging-enabled	Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries.
10.3.1	Record at least the following audit trail entries for all system components for each event: User identification	opensearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Record at least the following audit trail entries for all system components for each event: User identific ation	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Record at least the following audit trail entries for all system components for each event: User identification	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.
10.5	Secure audit trails so they cannot be altered.	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
10.5	Secure audit trails so they cannot be altered.	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
10.5	Secure audit trails so they cannot be altered.	s3-default-encryption-kms	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.
10.5.2	Protect audit trail files from unauthorized modifications.	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
10.5.2	Protect audit trail files from unauthorized modifications.	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
10.5.2	Protect audit trail files from unauthorized modifications.	s3-default-encryption-kms	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.5.3	Promptly back up audit trail files to a centralized log server or media that is difficult to alter.	s3-lifecycle-policy-check	Ensure Amazon S3 lifecycle policies are configured to help define actions that you want Amazon S3 to take during an object's lifetime (for example, transition objects to another storage class, archive them, or delete them after a specified period of time).

Control ID	Control Description	AWS Config Rule	Guidance
10.5.3	Promptly back up audit trail files to a centralized log server or media that is difficult to alter.	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
10.5.3	Promptly back up audit trail files to a centralized log server or media that is difficult to alter.	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
10.5.3	Promptly back up audit trail files to a centralized log server or media that is difficult to alter.	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
10.5.5	Use file-integrity monitoring or change-detection software on logs to ensure that existing log data cannot be changed without generating alerts (although new data being added should not cause an alert).	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
10.5.5	Use file-integrity monitoring or change-detection software on logs to ensure that existing log data cannot be changed without generating alerts (although new data being added should not cause an alert).	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and applicati on failures.
10.7	Retain audit trail history for at least one year, with a minimum of three months immediately available for analysis (for example, online, archived, or restorabl e from backup).	s3-lifecycle-policy-check	Ensure Amazon S3 lifecycle policies are configured to help define actions that you want Amazon S3 to take during an object's lifetime (for example, transition objects to another storage class, archive them, or delete them after a specified period of time).

Control ID	Control Description	AWS Config Rule	Guidance
10.7	Retain audit trail history for at least one year, with a minimum of three months immediately available for analysis (for example, online, archived, or restorable from backup).	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
11.2.3	Perform internal and external scans, and rescans as needed, after any significant change. Scans must be performed by qualified personnel.	ecr-private-image-scanning-enabled	Amazon Elastic Container Repository (ECR) image scanning assists in identifying software vulnerabilities in your container images. Enabling image scanning on ECR repositories adds a layer of verification for the integrity and safety of the images being stored.

Control ID	Control Description	AWS Config Rule	Guidance
11.4	Use intrusion-detection and/or intrusion-prevention techniques to detect and/or prevent intrusions into the network. Monitor all traffic at the perimeter of the cardholder data environment as well as at critical points in the cardholder data environment, and alert personnel to suspected compromises. Keep all intrusion-detection and prevention engines, baselines, and signatures up to date.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
11.4	Use intrusion-detection and/or intrusion-prevention techniques to detect and/or prevent intrusions into the network. Monitor all traffic at the perimeter of the cardholder data environment as well as at critical points in the cardholder data environment, and alert personnel to suspected compromises. Keep all intrusion-detection and prevention engines, baselines, and signatures up to date.	netfw-policy-rule-group-associated	An AWS Network Firewall policy defines how your firewall monitors and handles traffic in an Amazon VPC. You configure stateless and stateful rule groups to filter packets and traffic flows, and you define default traffic handling.

Control ID	Control Description	AWS Config Rule	Guidance
11.5	Deploy a change-detection mechanism (for example, file-integrity monitoring tools) to alert personnel to unauthorized modification (including changes, additions, and deletions) of critical system files, configuration files, or content files; and configure the software to perform critical file comparisons at least weekly.	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
11.5	Deploy a change-detection mechanism (for example, file-integrity monitoring tools) to alert personnel to unauthorized modification (including changes, additions, and deletions) of critical system files, configuration files, or content files; and configure the software to perform critical file comparisons at least weekly.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Template

The template is available on GitHub: Operational Best Practices for PCI DSS 3.2.1.

Operational Best Practices for PCI DSS 4.0 (Excluding global resource types)

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates,

are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Payment Card Industry Data Security Standard (PCI DSS) 4.0 (Excluding global resource types) and AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more PCI DSS controls. A PCI DSS control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.5	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	transfer-family-server-no-ftp	Ensure that a server created with AWS Transfer Family does not use FTP for endpoint connection. The rule is NON_COMPLIANT if the server protocol for endpoint connection is FTP-enabled.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	eks-endpoint-no-public-access	Ensure that the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	restricted-ssh	Note: For this rule, the rule identifie r (INCOMING _SSH_DISABLED) and rule name (restricted-ssh) are different. Ensure that the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	codebuild-project-source-repo-url-check	Ensure that the Bitbucket source repository URL DOES NOT contain sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGroupRuleRanges.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	nacl-no-unrestricted-ssh-rdp	Ensure that default ports for SSH/RDP ingress traffic for network access control lists (NACLs) are restricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	ec2-client-vpn-not-authorize-all	Ensure that the AWS Client VPN authorization rules does not authorize connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	redshift-enhanced-vpc-routing-enabled	Ensure that Amazon Redshift clusters have 'enhancedVpcRouting' enabled. The rule is NON_COMPLIANT if 'enhancedVpcRouting' is not enabled or if the configuration.enhancedVpcRouting field is 'false'.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	eks-endpoint-no-public-access	Ensure that the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	restricted-ssh	Note: For this rule, the rule identifier (INCOMING_SSH_DISABLED) and rule name (restricted-ssh) are different. Ensure that the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	codebuild-project-source-repo-url-check	Ensure that the Bitbucket source repository URL DOES NOT contain sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in PermittedPublicSecurityGroupRuleRanges.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	nacl-no-unrestricted-ssh-rdp	Ensure that default ports for SSH/RDP ingress traffic for network access control lists (NACLs) are restricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	ec2-client-vpn-not-authorize-all	Ensure that the AWS Client VPN authorization rules does not authorize connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	redshift-enhanced-vpc-routing-enabled	Ensure that Amazon Redshift clusters have 'enhancedVpcRouting' enabled. The rule is NON_COMPLIANT if 'enhancedVpcRouting' is not enabled or if the configuration.enhancedVpcRouting field is 'false'.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	eks-endpoint-no-public-access	Ensure that the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	restricted-ssh	Note: For this rule, the rule identifier (INCOMING_SSH_DISABLED) and rule name (restricted-ssh) are different. Ensure that the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	codebuild-project-source-repo-url-check	Ensure that the Bitbucket source repository URL DOES NOT contain sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in PermittedPublicSecurityGroupRuleRanges.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	nacl-no-unrestricted-ssh-rdp	Ensure that default ports for SSH/RDP ingress traffic for network access control lists (NACLs) are restricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	ec2-client-vpn-not-authorize-all	Ensure that the AWS Client VPN authorization rules does not authorize connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
1.4.1	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.1	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	redshift-enhanced-vpc-routing-enabled	Ensure that Amazon Redshift clusters have 'enhancedVpcRouting' enabled. The rule is NON_COMPLIANT if 'enhancedVpcRouting' is not enabled or if the configuration.enhancedVpcRouting field is 'false'.
1.4.1	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	redshift-enhanced-vpc-routing-enabled	Ensure that Amazon Redshift clusters have 'enhancedVpcRouting' enabled. The rule is NON_COMPLIANT if 'enhancedVpcRouting' is not enabled or if the configuration.enhancedVpcRouting field is 'false'.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	eks-endpoint-no-public-access	Ensure that the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	restricted-ssh	Note: For this rule, the rule identifie r (INCOMING _SSH_DISABLED) and rule name (restricted-ssh) are different. Ensure that the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	codebuild-project-source-repo-url-check	Ensure that the Bitbucket source repository URL DOES NOT contain sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGroupRuleRanges.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	nacl-no-unrestricted-ssh-rdp	Ensure that default ports for SSH/RDP ingress traffic for network access control lists (NACLs) are restricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	ec2-client-vpn-not-authorize-all	Ensure that the AWS Client VPN authorization rules does not authorize connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
1.4.3	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.3	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.
1.4.3	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	netfw-policy-default-action-full-packets	Ensure that an AWS Network Firewall policy is configured with a user defined default stateless action for full packets. This rule is NON_COMPLIANT if default stateless action for full packets does not match with user defined default stateless action.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.4	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.
1.4.4	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	redshift-enhanced-vpc-routing-enabled	Ensure that Amazon Redshift clusters have 'enhancedVpcRouting' enabled. The rule is NON_COMPLIANT if 'enhancedVpcRouting' is not enabled or if the configuration.enhancedVpcRouting field is 'false'.
1.4.4	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.5	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	ecs-task-definition-pid-mode-check	Ensure that ECSTaskDefinitions are configured to share a host's process namespace with its Amazon Elastic Container Service (Amazon ECS) containers. The rule is NON_COMPLIANT if the pidMode parameter is set to 'host'.
1.4.5	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	ec2-launch-template-public-ip-disabled	Ensure that Amazon EC2 Launch Templates are not set to assign public IP addresses to Network Interfaces. The rule is NON_COMPLIANT if the default version of an EC2 Launch Template has at least 1 Network Interface with 'AssociatePublicIpAddress' set to 'true'.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	eks-endpoint-no-public-access	Ensure that the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	restricted-ssh	Note: For this rule, the rule identifier (INCOMING_SSH_DISABLED) and rule name (restricted-ssh) are different. Ensure that the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	codebuild-project-source-repo-url-check	Ensure that the Bitbucket source repository URL DOES NOT contain sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	emr-block-public-a ccess	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurit yGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGrou pRuleRanges.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	nacl-no-unrestricted-ssh-rdp	Ensure that default ports for SSH/RDP ingress traffic for network access control lists (NACLs) are restricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	ec2-client-vpn-not-authorize-all	Ensure that the AWS Client VPN authorization rules does not authorize connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance

The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	cloudtrail-security-trail-enabled	Ensure that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:

Control ID	Control Description	AWS Config Rule	Guidance
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	neptune-cluster-snapshot-public-prohibited	Ensure that an Amazon Neptune manual DB cluster snapshot is not public. The rule is NON_COMPLIANT if any existing and new Neptune cluster snapshot is public.
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGroupRuleRanges.
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	aurora-resources-protected-by-backup-plan	Ensure that Amazon Aurora DB clusters are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon Relational Database Service (Amazon RDS) Database Cluster is not protected by a backup plan.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	db-instance-backup-enabled	Ensure that RDS DB instances have backups enabled. Optionally, the rule checks the backup retention period and the backup window.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	dynamodb-in-backup-plan	Ensure that Amazon DynamoDB tables are present in AWS Backup Plans. The rule is NON_COMPLIANT if Amazon DynamoDB tables are not present in any AWS Backup plan.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	dynamodb-resources-protected-by-backup-plan	Ensure that Amazon DynamoDB tables are protected by a backup plan. The rule is NON_COMPLIANT if the DynamoDB Table is not covered by a backup plan.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	ebs-in-backup-plan	Ensure that Amazon Elastic Block Store (Amazon EBS) volumes are added in backup plans of AWS Backup. The rule is NON_COMPLIANT if Amazon EBS volumes are not included in backup plans.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	ebs-resources-protected-by-backup-plan	Ensure that Amazon Elastic Block Store (Amazon EBS) volumes are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon EBS volume is not covered by a backup plan.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	ec2-resources-protected-by-backup-plan	Ensure that Amazon Elastic Compute Cloud (Amazon EC2) instances are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon EC2 instance is not covered by a backup plan.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	efs-resources-protected-by-backup-plan	Ensure that Amazon Elastic File System (Amazon EFS) file systems are protected by a backup plan. The rule is NON_COMPLIANT if the EFS File System is not covered by a backup plan.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	elasticache-redis-cluster-automatic-backup-check	Check if the Amazon ElastiCache Redis clusters have automatic backup turned on. The rule is NON_COMPLIANT if the SnapshotRetentionLimit for Redis cluster is less than the SnapshotRetentionPeriod parameter. For example: If the parameter is 15 then the rule is non-compliant if the snapshotRetentionPeriod is between 0-15.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	fsx-resources-protected-by-backup-plan	Ensure that Amazon FSx File Systems are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon FSx File System is not covered by a backup plan.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	neptune-cluster-backup-retention-check	Ensure that an Amazon Neptune DB cluster retention period is set to specific number of days. The rule is NON_COMPLIANT if the retention period is less than the value specified by the parameter.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	rds-in-backup-plan	Ensure that Amazon Relational Database Service (Amazon RDS) databases are present in AWS Backup plans. The rule is NON_COMPLIANT if Amazon RDS databases are not included in any AWS Backup plan.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	redshift-backup-enabled	Ensure that Amazon Redshift automated snapshots are enabled for clusters. The rule is NON_COMPLIANT if the value for automated SnapshotRetentionPeriod is greater than MaxRetentionPeriod or less than MinRetentionPeriod or the value is 0.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	s3-resources-protected-by-backup-plan	Ensure that Amazon Simple Storage Service (Amazon S3) buckets are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon S3 bucket is not covered by a backup plan.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	cloudtrail-security-trail-enabled	Ensure that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	db-instance-backup-enabled	Ensure that RDS DB instances have backups enabled. Optionally, the rule checks the backup retention period and the backup window.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.
10.3.4	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	s3-bucket-default-lock-enabled	Ensure that the S3 bucket has lock enabled, by default. The rule is NON_COMPLIANT if the lock is not enabled.
10.3.4	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	s3-bucket-versioning-enabled	Ensure that versioning is enabled for your S3 buckets. Optionally, the rule checks if MFA delete is enabled for your S3 buckets.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.4	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	cloudtrail-security-trail-enabled	Ensure that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.3	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.5.1	Audit log history is retained and available for analysis. (PCI-DSS-v4.0)	cloudtrail-security-trail-enabled	Ensure that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:
10.5.1	Audit log history is retained and available for analysis. (PCI-DSS-v4.0)	ec2-volume-inuse-check	Ensure that EBS volumes are attached to EC2 instances. Optionally ensure that EBS volumes are marked for deletion when an instance is terminated.

Control ID	Control Description	AWS Config Rule	Guidance
10.5.1	Audit log history is retained and available for analysis. (PCI-DSS-v4.0)	ecr-private-lifecycle-policy-configured	Ensure that a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repositor y.
10.5.1	Audit log history is retained and available for analysis. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.
10.5.1	Audit log history is retained and available for analysis. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPL IANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissions than the control Amazon S3 bucket policy that you provide.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
11.5.2	Network intrusions and unexpected file changes are detected and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
11.5.2	Network intrusions and unexpected file changes are detected and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
11.5.2	Network intrusions and unexpected file changes are detected and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-settings-check	Ensure that CloudWatch alarms with the given metric name have the specified settings.
11.5.2	Network intrusions and unexpected file changes are detected and responded to. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
11.6.1	Unauthorized changes on payment pages are detected and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
11.6.1	Unauthorized changes on payment pages are detected and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
11.6.1	Unauthorized changes on payment pages are detected and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-settings-check	Ensure that CloudWatch alarms with the given metric name have the specified settings.
11.6.1	Unauthorized changes on payment pages are detected and responded to. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
12.10.5	Suspected and confirmed security incidents that could impact the CDE are responded to immediately. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
12.10.5	Suspected and confirmed security incidents that could impact the CDE are responded to immediately. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
12.10.5	Suspected and confirmed security incidents that could impact the CDE are responded to immediately. (PCI-DSS-v4.0)	cloudwatch-alarm-settings-check	Ensure that CloudWatch alarms with the given metric name have the specified settings.

Control ID	Control Description	AWS Config Rule	Guidance
12.10.5	Suspected and confirmed security incidents that could impact the CDE are responded to immediately. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
12.4.2.1	PCI DSS compliance is managed. (PCI-DSS-v4.0)	service-catalog-shared-within-organization	Ensure that AWS Service Catalog shares portfolios to an organization (a collection of AWS accounts treated as a single unit) when integration is enabled with AWS Organizations. The rule is NON_COMPLIANT if the `Type` value of a share is `ACCOUNT`.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.5	System components are configured and managed securely. (PCI-DSS-v4.0)	transfer-family-server-no-ftp	Ensure that a server created with AWS Transfer Family does not use FTP for endpoint connection. The rule is NON_COMPLIANT if the server protocol for endpoint connection is FTP-enabled.
2.2.7	System components are configured and managed securely. (PCI-DSS-v4.0)	dms-redis-tls-enabled	Ensure that AWS Database Migration Service (AWS DMS) endpoints for Redis data stores are enabled for TLS/SSL encryption of data communicated with other endpoints. The rule is NON_COMPLIANT if TLS/SSL encryption is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.7	System components are configured and managed securely. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.
2.2.7	System components are configured and managed securely. (PCI-DSS-v4.0)	msk-in-cluster-node-require-tls	Ensure that an Amazon MSK cluster enforces encryption in transit using HTTPS (TLS) with the broker nodes of the cluster. The rule is NON_COMPLIANT if plain text communication is enabled for in-cluster broker node connections.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.7	System components are configured and managed securely. (PCI-DSS-v4.0)	dms-endpoint-ssl-configured	Ensure that AWS Database Migration Service (AWS DMS) endpoints are configured with an SSL connection. The rule is NON_COMPLIANT if AWS DMS does not have an SSL connection configured.
3.2.1	Storage of account data is kept to a minimum. (PCI-DSS-v4.0)	ec2-volume-inuse-check	Ensure that EBS volumes are attached to EC2 instances. Optionally ensure that EBS volumes are marked for deletion when an instance is terminated.
3.2.1	Storage of account data is kept to a minimum. (PCI-DSS-v4.0)	ecr-private-lifecycle-policy-configured	Ensure that a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repository.

Control ID	Control Description	AWS Config Rule	Guidance
3.2.1	Storage of account data is kept to a minimum. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.
3.2.1	Storage of account data is kept to a minimum. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPLIANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.
3.3.1.1	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ec2-volume-inuse-check	Ensure that EBS volumes are attached to EC2 instances. Optionally ensure that EBS volumes are marked for deletion when an instance is terminated.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1.1	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ecr-private-lifecycle-policy-configured	Ensure that a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repository.
3.3.1.1	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.
3.3.1.1	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPLIANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ec2-volume-inuse-check	Ensure that EBS volumes are attached to EC2 instances. Optionally ensure that EBS volumes are marked for deletion when an instance is terminated.
3.3.1.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ecr-private-lifecycle-policy-configured	Ensure that a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repository.
3.3.1.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPLIANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.
3.3.2	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ec2-volume-inuse-check	Ensure that EBS volumes are attached to EC2 instances. Optionally ensure that EBS volumes are marked for deletion when an instance is terminated.
3.3.2	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ecr-private-lifecycle-policy-configured	Ensure that a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repository.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.2	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.
3.3.2	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPLIANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.
3.3.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ec2-volume-inuse-check	Ensure that EBS volumes are attached to EC2 instances. Optionally ensure that EBS volumes are marked for deletion when an instance is terminated.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ecr-private-lifecycle-policy-configured	Ensure that a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repository.
3.3.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.
3.3.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPLIANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	athena-workgroup-encrypted-at-rest	Ensure that an Amazon Athena workgroup is encrypted at rest. The rule is NON_COMPLIANT if encryption of data at rest is not enabled for an Athena workgroup.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	neptune-cluster-snapshot-encrypted	Ensure that an Amazon Neptune DB cluster has snapshots encrypted. The rule is NON_COMPLIANT if a Neptune cluster does not have snapshots encrypted.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	redshift-cluster-kms-enabled	Ensure that Amazon Redshift clusters are using a specified AWS Key Management Service (AWS KMS) key for encryptio n. The rule is COMPLIANT if encryption is enabled and the cluster is encrypted with the key provided in the kmsKeyArn parameter. The rule is NON_COMPL IANT if the cluster is not encrypted or encrypted with another key.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	codebuild-project-s3-logs-encrypted	Ensure that an AWS CodeBuild project configured with Amazon S3 Logs has encryption enabled for its logs. The rule is NON_COMPLIANT if 'encryptionDisable d' is set to 'true' in a S3LogsConfig of a CodeBuild project.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	eks-secrets-encrypted	Ensure that Amazon Elastic Kubernetes Service clusters are configured to have Kubernetes secrets encrypted using AWS Key Management Service (KMS) keys.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	api-gw-cache-enabled-and-encrypted	Ensure that all methods in Amazon API Gateway stages have cache enabled and cache encrypted. The rule is NON_COMPLIANT if any method in an Amazon API Gateway stage is not configured to cache or the cache is not encrypted.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	dynamodb-table-encrypted-kms	Ensure that Amazon DynamoDB table is encrypted with AWS Key Management Service (KMS). The rule is NON_COMPLIANT if Amazon DynamoDB table is not encrypted with AWS KMS. The rule is also NON_COMPLIANT if the encrypted AWS KMS key is not present in kmsKeyArns input parameter.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	codebuild-project-envvar-awscred-check	Ensure that the project DOES NOT contain environment variables AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY. The rule is NON_COMPLIANT when the project environment variables contains plaintext credentials.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	eks-cluster-secrets-encrypted	Ensure that Amazon EKS clusters are not configured to have Kubernetes secrets encrypted using AWS KMS. The rule is NON_COMPLIANT if an EKS cluster does not have an encryptionConfig resource or if encryptionConfig does not name secrets as a resource.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	kinesis-stream-encrypted	Ensure that Amazon Kinesis streams are encrypted at rest with server-side encryption. The rule is NON_COMPLIANT for a Kinesis stream if 'StreamEncryption' is not present.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	neptune-cluster-encrypted	Ensure that storage encryption is enabled for your Amazon Neptune DB clusters. The rule is NON_COMPLIANT if storage encryption is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
3.5.1.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	neptune-cluster-snapshot-public-prohibited	Ensure that an Amazon Neptune manual DB cluster snapshot is not public. The rule is NON_COMPLIANT if any existing and new Neptune cluster snapshot is public.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in PermittedPublicSecurityGroupRuleRanges.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
3.6.1	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1.2	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
3.6.1.2	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1.3	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
3.6.1.3	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1.4	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
3.6.1.4	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.1	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	acm-certificate-rsa-check	Ensure that RSA certificates managed by AWS Certificate Manager (ACM) have a key length of at least '2048' bits.The rule is NON_COMPL IANT if the minimum key length is less than 2048 bits.
3.7.1	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	acm-pca-root-ca-di sabled	Ensure that AWS Private Certifica te Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.1	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
3.7.2	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	acm-pca-root-ca-di sabled	Ensure that AWS Private Certifica te Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.2	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
3.7.4	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	acm-pca-root-ca-di sabled	Ensure that AWS Private Certifica te Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.4	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
3.7.6	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	acm-pca-root-ca-di sabled	Ensure that AWS Private Certifica te Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.6	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
3.7.7	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	acm-pca-root-ca-di sabled	Ensure that AWS Private Certifica te Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.7	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
4.2.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	dms-redis-tls-enab led	Ensure that AWS Database Migration Service (AWS DMS) endpoints for Redis data stores are enabled for TLS/SSL encryption of data communicated with other endpoints. The rule is NON_COMPL IANT if TLS/SSL encryption is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
4.2.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
4.2.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	msk-in-cluster-node-require-tls	Ensure that an Amazon MSK cluster enforces encryptio n in transit using HTTPS (TLS) with the broker nodes of the cluster. The rule is NON_COMPLIANT if plain text communica tion is enabled for in-cluster broker node connections.

Control ID	Control Description	AWS Config Rule	Guidance
4.2.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	dms-endpoint-ssl-configured	Ensure that AWS Database Migration Service (AWS DMS) endpoints are configured with an SSL connection. The rule is NON_COMPLIANT if AWS DMS does not have an SSL connection configured.
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.

Control ID	Control Description	AWS Config Rule	Guidance
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	dms-redis-tls-enabled	Ensure that AWS Database Migration Service (AWS DMS) endpoints for Redis data stores are enabled for TLS/SSL encryption of data communicated with other endpoints. The rule is NON_COMPLIANT if TLS/SSL encryption is not enabled.
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	msk-in-cluster-node-require-tls	Ensure that an Amazon MSK cluster enforces encryption in transit using HTTPS (TLS) with the broker nodes of the cluster. The rule is NON_COMPLIANT if plain text communication is enabled for in-cluster broker node connections.
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	dms-endpoint-ssl-configured	Ensure that AWS Database Migration Service (AWS DMS) endpoints are configured with an SSL connection. The rule is NON_COMPLIANT if AWS DMS does not have an SSL connection configured.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	cloudtrail-security-trail-enabled	Ensure that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPLIANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.
6.3.3	Security vulnerabilities are identified and addressed. (PCI-DSS-v4.0)	lambda-function-settings-check	Ensure that the AWS Lambda function settings for runtime, role, timeout, and memory size match the expected values. The rule ignores functions with the 'Image' package type and functions with runtime set to 'OS-only Runtime'. The rule is NON_COMPLIANT if the Lambda function settings do not match the expected values.

Control ID	Control Description	AWS Config Rule	Guidance
6.3.3	Security vulnerabilities are identified and addressed. (PCI-DSS-v4.0)	eks-cluster-oldest-supported-version	Ensure that an Amazon Elastic Kubernetes Service (EKS) cluster is not running the oldest supported version. The rule is NON_COMPLIANT if an EKS cluster is running oldest supported version (equal to the parameter 'oldestVersionSupported').
6.4.1	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.
6.4.1	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	wafv2-webacl-not-empty	Ensure that a WAFv2 Web ACL contains any WAF rules or WAF rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rules or WAF rule groups.

Control ID	Control Description	AWS Config Rule	Guidance
6.4.1	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	wafv2-rulegroup-not-empty	Ensure that WAFv2 Rule Groups contain rules. The rule is NON_COMPLIANT if there are no rules in a WAFv2 Rule Group.
6.4.2	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.
6.4.2	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	wafv2-webacl-not-empty	Ensure that a WAFv2 Web ACL contains any WAF rules or WAF rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rules or WAF rule groups.
6.4.2	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	wafv2-rulegroup-not-empty	Ensure that WAFv2 Rule Groups contain rules. The rule is NON_COMPLIANT if there are no rules in a WAFv2 Rule Group.

Control ID	Control Description	AWS Config Rule	Guidance
6.5.5	Changes to all system components are managed securely. (PCI-DSS-v4.0)	codedeploy-lambda-allatonce-traffic-shift-disabled	Ensure that the deployment group for Lambda Compute Platform is not using the default deployment configuration. The rule is NON_COMPLIANT if the deployment group is using the deployment configuration 'CodeDeployDefault.LambdaAllAtOnce'.
6.5.6	Changes to all system components are managed securely. (PCI-DSS-v4.0)	codedeploy-lambda-allatonce-traffic-shift-disabled	Ensure that the deployment group for Lambda Compute Platform is not using the default deployment configuration. The rule is NON_COMPLIANT if the deployment group is using the deployment configuration 'CodeDeployDefault.LambdaAllAtOnce'.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentic ation enabled. The rule is NON_COMPL IANT if an Amazon Neptune cluster does not have IAM database authentic ation enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentic ation enabled. The rule is NON_COMPL IANT if an Amazon Neptune cluster does not have IAM database authentic ation enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
7.2.4	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	secretsmanager-secret-unused	Ensure that AWS Secrets Manager secrets have been accessed within a specified number of days. The rule is NON_COMPLIANT if a secret has not been accessed in 'unusedForDays' number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentic ation enabled. The rule is NON_COMPL IANT if an Amazon Neptune cluster does not have IAM database authentic ation enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
7.2.5.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	secretsmanager-secret-unused	Ensure that AWS Secrets Manager secrets have been accessed within a specified number of days. The rule is NON_COMPLIANT if a secret has not been accessed in 'unusedForDays' number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.6	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.6	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentic ation enabled. The rule is NON_COMPL IANT if an Amazon Neptune cluster does not have IAM database authentic ation enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentic ation enabled. The rule is NON_COMPL IANT if an Amazon Neptune cluster does not have IAM database authentic ation enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentic ation enabled. The rule is NON_COMPL IANT if an Amazon Neptune cluster does not have IAM database authentic ation enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
8.2.1	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-no-amazon-key-pair	Ensure that running Amazon Elastic Compute Cloud (EC2) instances are not launched using amazon key pairs. The rule is NON_COMPLIANT if a running EC2 instance is launched with a key pair.
8.2.2	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.2	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-no-amazon-key-pair	Ensure that running Amazon Elastic Compute Cloud (EC2) instances are not launched using amazon key pairs. The rule is NON_COMPLIANT if a running EC2 instance is launched with a key pair.
8.2.2	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	codebuild-project-envvar-awscred-check	Ensure that the project DOES NOT contain environment variables AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY. The rule is NON_COMPLIANT when the project environment variables contains plaintext credentials.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.2	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	secretsmanager-scheduled-rotation-success-check	Ensure that AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.
8.2.2	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	secretsmanager-secret-periodic-rotation	Ensure that AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.2	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	secretsmanager-secret-unused	Ensure that AWS Secrets Manager secrets have been accessed within a specified number of days. The rule is NON_COMPLIANT if a secret has not been accessed in 'unusedForDays' number of days. The default value is 90 days.
8.2.4	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
8.2.4	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-no-amazon-key-pair	Ensure that running Amazon Elastic Compute Cloud (EC2) instances are not launched using amazon key pairs. The rule is NON_COMPLIANT if a running EC2 instance is launched with a key pair.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.5	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
8.2.5	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-no-amazon-key-pair	Ensure that running Amazon Elastic Compute Cloud (EC2) instances are not launched using amazon key pairs. The rule is NON_COMPLIANT if a running EC2 instance is launched with a key pair.
8.2.6	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	secretsmanager-secret-unused	Ensure that AWS Secrets Manager secrets have been accessed within a specified number of days. The rule is NON_COMPLIANT if a secret has not been accessed in 'unusedForDays' number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissions than the control Amazon S3 bucket policy that you provide.
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissions than the control Amazon S3 bucket policy that you provide.
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-imdsv2-check	Ensure that your Amazon Elastic Compute Cloud (Amazon EC2) instance metadata version is configured with Instance Metadata Service Version 2 (IMDSv2). The rule is NON_COMPLIANT if the HttpTokens is set to optional.
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	autoscaling-launchconfig-requires-imdsv2	Ensure that only IMDSv2 is enabled. This rule is NON_COMPLIANT if the Metadata version is not included in the launch configuration or if both Metadata V1 and V2 are enabled.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
8.3.10.1	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	access-keys-rotated	Ensure that active IAM access keys are rotated (changed) within the number of days specified in maxAccessKeyAge. The rule is NON_COMPLIANT if access keys are not rotated within the specified time period. The default value is 90 days.
8.3.10.1	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-scheduled-rotation-success-check	Ensure that AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.10.1	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-secret-periodic-rotation	Ensure that AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.
8.3.11	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
8.3.11	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	ec2-no-amazon-key-pair	Ensure that running Amazon Elastic Compute Cloud (EC2) instances are not launched using amazon key pairs. The rule is NON_COMPLIANT if a running EC2 instance is launched with a key pair.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	athena-workgroup-encrypted-at-rest	Ensure that an Amazon Athena workgroup is encrypted at rest. The rule is NON_COMPLIANT if encryption of data at rest is not enabled for an Athena workgroup.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	neptune-cluster-snapshot-encrypted	Ensure that an Amazon Neptune DB cluster has snapshots encrypted. The rule is NON_COMPLIANT if a Neptune cluster does not have snapshots encrypted.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentic ation for users and administrators is established and managed. (PCI-DSS-v4.0)	redshift-cluster-kms-enabled	Ensure that Amazon Redshift clusters are using a specified AWS Key Management Service (AWS KMS) key for encryptio n. The rule is COMPLIANT if encryption is enabled and the cluster is encrypted with the key provided in the kmsKeyArn parameter. The rule is NON_COMPL IANT if the cluster is not encrypted or encrypted with another key.
8.3.2	Strong authentic ation for users and administrators is established and managed. (PCI-DSS-v4.0)	codebuild-project-s3-logs-encrypted	Ensure that an AWS CodeBuild project configured with Amazon S3 Logs has encryption enabled for its logs. The rule is NON_COMPLIANT if 'encryptionDisable d' is set to 'true' in a S3LogsConfig of a CodeBuild project.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	dms-redis-tls-enabled	Ensure that AWS Database Migration Service (AWS DMS) endpoints for Redis data stores are enabled for TLS/SSL encryption of data communicated with other endpoints. The rule is NON_COMPLIANT if TLS/SSL encryption is not enabled.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	eks-secrets-encrypted	Ensure that Amazon Elastic Kubernetes Service clusters are configured to have Kubernetes secrets encrypted using AWS Key Management Service (KMS) keys.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	api-gw-cache-enabled-and-encrypted	Ensure that all methods in Amazon API Gateway stages have cache enabled and cache encrypted. The rule is NON_COMPLIANT if any method in an Amazon API Gateway stage is not configured to cache or the cache is not encrypted.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	dynamodb-table-encrypted-kms	Ensure that Amazon DynamoDB table is encrypted with AWS Key Management Service (KMS). The rule is NON_COMPLIANT if Amazon DynamoDB table is not encrypted with AWS KMS. The rule is also NON_COMPLIANT if the encrypted AWS KMS key is not present in kmsKeyArns input parameter.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	codebuild-project-envvar-awscred-check	Ensure that the project DOES NOT contain environment variables AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY. The rule is NON_COMPLIANT when the project environment variables contains plaintext credentials.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentic ation for users and administrators is established and managed. (PCI-DSS-v4.0)	eks-cluster-secrets-encrypted	Ensure that Amazon EKS clusters are not configured to have Kubernetes secrets encrypted using AWS KMS. The rule is NON_COMPLIANT if an EKS cluster does not have an encryptio nConfig resource or if encryptionConfig does not name secrets as a resource.
8.3.2	Strong authentic ation for users and administrators is established and managed. (PCI-DSS-v4.0)	kinesis-stream-enc rypted	Ensure that Amazon Kinesis streams are encrypted at rest with server-side encryption. The rule is NON_COMPLIANT for a Kinesis stream if 'StreamEncryption' is not present.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	msk-in-cluster-node-require-tls	Ensure that an Amazon MSK cluster enforces encryption in transit using HTTPS (TLS) with the broker nodes of the cluster. The rule is NON_COMPLIANT if plain text communication is enabled for in-cluster broker node connections.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	neptune-cluster-encrypted	Ensure that storage encryption is enabled for your Amazon Neptune DB clusters. The rule is NON_COMPLIANT if storage encryption is not enabled.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	dms-endpoint-ssl-configured	Ensure that AWS Database Migration Service (AWS DMS) endpoints are configured with an SSL connection. The rule is NON_COMPLIANT if AWS DMS does not have an SSL connection configured.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissions than the control Amazon S3 bucket policy that you provide.
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
8.3.5	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	access-keys-rotated	Ensure that active IAM access keys are rotated (changed) within the number of days specified in maxAccessKeyAge. The rule is NON_COMPLIANT if access keys are not rotated within the specified time period. The default value is 90 days.
8.3.5	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-scheduled-rotation-success-check	Ensure that AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.5	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-secret-periodic-rotation	Ensure that AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.
8.3.7	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	access-keys-rotated	Ensure that active IAM access keys are rotated (changed) within the number of days specified in maxAccessKeyAge. The rule is NON_COMPLIANT if access keys are not rotated within the specified time period. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.7	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-scheduled-rotation-success-check	Ensure that AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.
8.3.7	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-secret-periodic-rotation	Ensure that AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.9	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	access-keys-rotated	Ensure that active IAM access keys are rotated (changed) within the number of days specified in maxAccessKeyAge. The rule is NON_COMPLIANT if access keys are not rotated within the specified time period. The default value is 90 days.
8.3.9	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-scheduled-rotation-success-check	Ensure that AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.9	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-secret-periodic-rotation	Ensure that AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.
8.4.1	Multi-factor authentication (MFA) is implemented to secure access into the CDE. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.
8.4.2	Multi-factor authentication (MFA) is implemented to secure access into the CDE. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
8.4.3	Multi-factor authentication (MFA) is implemented to secure access into the CDE. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.
8.6.3	Use of application and system accounts and associated authentication factors is strictly managed. (PCI-DSS-v4.0)	access-keys-rotated	Ensure that active IAM access keys are rotated (changed) within the number of days specified in maxAccessKeyAge. The rule is NON_COMPLIANT if access keys are not rotated within the specified time period. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.6.3	Use of application and system accounts and associated authentication factors is strictly managed. (PCI-DSS-v4.0)	secretsmanager-scheduled-rotation-success-check	Ensure that AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.
8.6.3	Use of application and system accounts and associated authentication factors is strictly managed. (PCI-DSS-v4.0)	secretsmanager-secret-periodic-rotation	Ensure that AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	neptune-cluster-snapshot-public-prohibited	Ensure that an Amazon Neptune manual DB cluster snapshot is not public. The rule is NON_COMPLIANT if any existing and new Neptune cluster snapshot is public.
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in PermittedPublicSecurityGroupRuleRanges.
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	eks-endpoint-no-public-access	Ensure that the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	restricted-ssh	Note: For this rule, the rule identifier (INCOMING_SSH_DISABLED) and rule name (restricted-ssh) are different. Ensure that the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	codebuild-project-source-repo-url-check	Ensure that the Bitbucket source repository URL DOES NOT contain sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	emr-block-public-a ccess	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurit yGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGrou pRuleRanges.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	nacl-no-unrestricted-ssh-rdp	Ensure that default ports for SSH/RDP ingress traffic for network access control lists (NACLs) are restricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	ec2-client-vpn-not-authorize-all	Ensure that the AWS Client VPN authorization rules does not authorize connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	cloudtrail-security-trail-enabled	Ensure that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
A1.2.3	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	security-account-information-provided	Ensure that you have provided security contact information for your AWS account contacts. The rule is NON_COMPLIANT if security contact information within the account is not provided.

Control ID	Control Description	AWS Config Rule	Guidance
A3.2.5.1	PCI DSS scope is documented and validated. (PCI-DSS-v4.0)	macie-auto-sensitive-data-discovery-check	Ensure that automated sensitive data discovery is enabled for Amazon Macie. The rule is NON_COMPLIANT if automated sensitive data discovery is disabled. The rule is APPLICABLE for administrator accounts and NOT_APPLICABLE for member accounts.
A3.2.5.1	PCI DSS scope is documented and validated. (PCI-DSS-v4.0)	macie-status-check	Ensure that Amazon Macie is enabled in your account per region. The rule is NON_COMPLIANT if the 'status' attribute is not set to 'ENABLED'.

Control ID	Control Description	AWS Config Rule	Guidance
A3.2.5.2	PCI DSS scope is documented and validated. (PCI-DSS-v4.0)	macie-auto-sensitive-data-discovery-check	Ensure that automated sensitive data discovery is enabled for Amazon Macie. The rule is NON_COMPLIANT if automated sensitive data discovery is disabled. The rule is APPLICABLE for administrator accounts and NOT_APPLICABLE for member accounts.
A3.2.5.2	PCI DSS scope is documented and validated. (PCI-DSS-v4.0)	macie-status-check	Ensure that Amazon Macie is enabled in your account per region. The rule is NON_COMPLIANT if the 'status' attribute is not set to 'ENABLED'.
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.

Control ID	Control Description	AWS Config Rule	Guidance
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.

Control ID	Control Description	AWS Config Rule	Guidance
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudwatch-alarm-settings-check	Ensure that CloudWatch alarms with the given metric name have the specified settings.
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	neptune-cluster-snapshot-public-prohibited	Ensure that an Amazon Neptune manual DB cluster snapshot is not public. The rule is NON_COMPLIANT if any existing and new Neptune cluster snapshot is public.
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGroupRuleRanges.
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	secretsmanager-secret-unused	Ensure that AWS Secrets Manager secrets have been accessed within a specified number of days. The rule is NON_COMPLIANT if a secret has not been accessed in 'unusedForDays' number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.

Control ID	Control Description	AWS Config Rule	Guidance
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-settings-check	Ensure that CloudWatch alarms with the given metric name have the specified settings.
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.

Template

The template is available on GitHub: Operational Best Practices for PCI DSS 4.0 (Excluding global resource types).

Operational Best Practices for PCI DSS 4.0 (Including global resource types)

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Payment Card Industry Data Security Standard (PCI DSS) 4.0 (Excluding global resource types) and AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more PCI DSS controls. A PCI DSS control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.5	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	cloudfront-security-policy-check	Ensure that Amazon CloudFront distributions are using a minimum security policy and cipher suite of TLSv1.2 or greater for viewer connections. This rule is NON_COMPLIANT for a CloudFront distribution if the minimumProtocolVersion is below TLSv1.2_2018.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.5	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	cloudfront-sni-enabled	Ensure that Amazon CloudFront distributions are using a custom SSL certificate and are configured to use SNI to serve HTTPS requests. The rule is NON_COMPLIANT if a custom SSL certificate is associated but the SSL support method is a dedicated IP address.
1.2.5	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	transfer-family-server-no-ftp	Ensure that a server created with AWS Transfer Family does not use FTP for endpoint connection. The rule is NON_COMPLIANT if the server protocol for endpoint connection is FTP-enabled.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.5	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	cloudfront-no-deprecated-ssl-protocols	Ensure that CloudFront distributions are not using deprecated SSL protocols for HTTPS communication between CloudFront edge locations and custom origins. This rule is NON_COMPLIANT for a CloudFront distribution if any'OriginSslProtocols' includes'SSLv3'.
1.2.5	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	cloudfront-traffic-to-origin-encrypted	Ensure that Amazon CloudFront distributions are encrypting traffic to custom origins. The rule is NON_COMPLIANT if'OriginProtocolPolicy' is'http-only' or if'OriginProtocolPolicy' is'match-viewer' and'ViewerProtocolPolicy' is'allow-all'.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.5	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	cloudfront-viewer-policy-https	Ensure that your Amazon CloudFront distributions use HTTPS (directly or via a redirection). The rule is NON_COMPLIANT if the value of ViewerProtocolPolicy is set to 'allow-all' for the DefaultCacheBehavior or for the CacheBehaviors.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	cloudfront-associated-with-waf	Ensure that Amazon CloudFront distributions are associated with either web application firewall (WAF) or WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT if a CloudFront distribution is not associated with a WAF web ACL.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	rds-db-security-group-not-allowed	Ensure that the Amazon Relational Database Service (Amazon RDS) DB security groups is the default one. The rule is NON_COMPLIANT if there are any DB security groups that are not the default DB security group.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	ec2-transit-gateway-auto-vpc-attach-disabled	Ensure that Amazon Elastic Compute Cloud (Amazon EC2) Transit Gateways do not have 'AutoAcceptSharedAttachments' enabled. The rule is NON_COMPLIANT for a Transit Gateway if 'AutoAcceptSharedAttachments' is set to 'enable'.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	eks-endpoint-no-public-access	Ensure that the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	restricted-ssh	Note: For this rule, the rule identifie r (INCOMING _SSH_DISABLED) and rule name (restricted-ssh) are different. Ensure that the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	docdb-cluster-snapshot-public-prohibited	Ensure that Amazon DocumentDB manual cluster snapshots are not public. The rule is NON_COMPLIANT if any Amazon DocumentDB manual cluster snapshots are public.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	codebuild-project-source-repo-url-check	Ensure that the Bitbucket source repository URL DOES NOT contain sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGroupRuleRanges.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	nacl-no-unrestricted-ssh-rdp	Ensure that default ports for SSH/RDP ingress traffic for network access control lists (NACLs) are restricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	waf-global-webacl-not-empty	Ensure that a WAF Global Web ACL contains some WAF rules or rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rule or rule group.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	waf-global-rulegroup-not-empty	Ensure that an AWS WAF Classic rule group contains some rules. The rule is NON_COMPLIANT if there are no rules present within a rule group.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	waf-global-rule-not-empty	Ensure that an AWS WAF global rule contains some conditions. The rule is NON_COMPLIANT if no conditions are present within the WAF global rule.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	ec2-client-vpn-not-authorize-all	Ensure that the AWS Client VPN authorization rules does not authorize connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
1.2.8	Network security controls (NSCs) are configured and maintained. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	cloudfront-associated-with-waf	Ensure that Amazon CloudFront distributions are associated with either web application firewall (WAF) or WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT if a CloudFront distribution is not associated with a WAF web ACL.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	rds-db-security-group-not-allowed	Ensure that the Amazon Relational Database Service (Amazon RDS) DB security groups is the default one. The rule is NON_COMPLIANT if there are any DB security groups that are not the default DB security group.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	redshift-enhanced-vpc-routing-enabled	Ensure that Amazon Redshift clusters have 'enhancedVpcRouting' enabled. The rule is NON_COMPLIANT if 'enhancedVpcRouting' is not enabled or if the configuration.enhancedVpcRouting field is 'false'.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	ec2-transit-gateway-auto-vpc-attach-disabled	Ensure that Amazon Elastic Compute Cloud (Amazon EC2) Transit Gateways do not have 'AutoAcceptSharedAttachments' enabled. The rule is NON_COMPLIANT for a Transit Gateway if 'AutoAcceptSharedAttachments' is set to 'enable'.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	eks-endpoint-no-public-access	Ensure that the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	restricted-ssh	Note: For this rule, the rule identifier (INCOMING_SSH_DISABLED) and rule name (restricted-ssh) are different. Ensure that the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	docdb-cluster-snapshot-public-prohibited	Ensure that Amazon DocumentDB manual cluster snapshots are not public. The rule is NON_COMPLIANT if any Amazon DocumentDB manual cluster snapshots are public.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	codebuild-project-source-repo-url-check	Ensure that the Bitbucket source repository URL DOES NOT contain sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in PermittedPublicSecurityGroupRuleRanges.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	nacl-no-unrestricted-ssh-rdp	Ensure that default ports for SSH/RDP ingress traffic for network access control lists (NACLs) are restricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	waf-global-webacl-not-empty	Ensure that a WAF Global Web ACL contains some WAF rules or rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rule or rule group.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	waf-global-rulegroup-not-empty	Ensure that an AWS WAF Classic rule group contains some rules. The rule is NON_COMPLIANT if there are no rules present within a rule group.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	waf-global-rule-not-empty	Ensure that an AWS WAF global rule contains some conditions. The rule is NON_COMPLIANT if no conditions are present within the WAF global rule.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	ec2-client-vpn-not-authorize-all	Ensure that the AWS Client VPN authorization rules does not authorize connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
1.3.1	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	cloudfront-associated-with-waf	Ensure that Amazon CloudFront distributions are associated with either web application firewall (WAF) or WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT if a CloudFront distribution is not associated with a WAF web ACL.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	rds-db-security-group-not-allowed	Ensure that the Amazon Relational Database Service (Amazon RDS) DB security groups is the default one. The rule is NON_COMPLIANT if there are any DB security groups that are not the default DB security group.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	redshift-enhanced-vpc-routing-enabled	Ensure that Amazon Redshift clusters have 'enhancedVpcRouting' enabled. The rule is NON_COMPLIANT if 'enhancedVpcRouting' is not enabled or if the configuration.enhancedVpcRouting field is 'false'.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	ec2-transit-gateway-auto-vpc-attach-disabled	Ensure that Amazon Elastic Compute Cloud (Amazon EC2) Transit Gateways do not have 'AutoAcceptSharedAttachments' enabled. The rule is NON_COMPLIANT for a Transit Gateway if 'AutoAcceptSharedAttachments' is set to 'enable'.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	eks-endpoint-no-public-access	Ensure that the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	restricted-ssh	Note: For this rule, the rule identifier (INCOMING_SSH_DISABLED) and rule name (restricted-ssh) are different. Ensure that the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	docdb-cluster-snapshot-public-prohibited	Ensure that Amazon DocumentDB manual cluster snapshots are not public. The rule is NON_COMPLIANT if any Amazon DocumentDB manual cluster snapshots are public.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	codebuild-project-source-repo-url-check	Ensure that the Bitbucket source repository URL DOES NOT contain sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in PermittedPublicSecurityGroupRuleRanges.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	nacl-no-unrestricted-ssh-rdp	Ensure that default ports for SSH/RDP ingress traffic for network access control lists (NACLs) are restricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	waf-global-webacl-not-empty	Ensure that a WAF Global Web ACL contains some WAF rules or rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rule or rule group.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	waf-global-rulegroup-not-empty	Ensure that an AWS WAF Classic rule group contains some rules. The rule is NON_COMPLIANT if there are no rules present within a rule group.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	waf-global-rule-not-empty	Ensure that an AWS WAF global rule contains some conditions. The rule is NON_COMPLIANT if no conditions are present within the WAF global rule.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	ec2-client-vpn-not-authorize-all	Ensure that the AWS Client VPN authorization rules does not authorize connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Control ID	Control Description	AWS Config Rule	Guidance
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
1.3.2	Network access to and from the cardholder data environment is restricted. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
1.4.1	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.1	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	redshift-enhanced-vpc-routing-enabled	Ensure that Amazon Redshift clusters have 'enhancedVpcRouting' enabled. The rule is NON_COMPLIANT if 'enhancedVpcRouting' is not enabled or if the configuration.enhancedVpcRouting field is 'false'.
1.4.1	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	cloudfront-associated-with-waf	Ensure that Amazon CloudFront distributions are associated with either web application firewall (WAF) or WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT if a CloudFront distribution is not associated with a WAF web ACL.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	rds-db-security-group-not-allowed	Ensure that the Amazon Relational Database Service (Amazon RDS) DB security groups is the default one. The rule is NON_COMPLIANT if there are any DB security groups that are not the default DB security group.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	redshift-enhanced-vpc-routing-enabled	Ensure that Amazon Redshift clusters have 'enhancedVpcRouting' enabled. The rule is NON_COMPLIANT if 'enhancedVpcRouting' is not enabled or if the configuration.enhancedVpcRouting field is 'false'.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	ec2-transit-gateway-auto-vpc-attach-disabled	Ensure that Amazon Elastic Compute Cloud (Amazon EC2) Transit Gateways do not have 'AutoAcceptSharedAttachments' enabled. The rule is NON_COMPLIANT for a Transit Gateway if 'AutoAcceptSharedAttachments' is set to 'enable'.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	eks-endpoint-no-public-access	Ensure that the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	restricted-ssh	Note: For this rule, the rule identifie r (INCOMING _SSH_DISABLED) and rule name (restricted-ssh) are different. Ensure that the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	docdb-cluster-snapshot-public-prohibited	Ensure that Amazon DocumentDB manual cluster snapshots are not public. The rule is NON_COMPLIANT if any Amazon DocumentDB manual cluster snapshots are public.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	codebuild-project-source-repo-url-check	Ensure that the Bitbucket source repository URL DOES NOT contain sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	emr-block-public-a ccess	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurit yGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGrou pRuleRanges.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	nacl-no-unrestricted-ssh-rdp	Ensure that default ports for SSH/RDP ingress traffic for network access control lists (NACLs) are restricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	waf-global-webacl-not-empty	Ensure that a WAF Global Web ACL contains some WAF rules or rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rule or rule group.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	waf-global-rulegroup-not-empty	Ensure that an AWS WAF Classic rule group contains some rules. The rule is NON_COMPLIANT if there are no rules present within a rule group.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	waf-global-rule-not-empty	Ensure that an AWS WAF global rule contains some conditions. The rule is NON_COMPLIANT if no conditions are present within the WAF global rule.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	ec2-client-vpn-not-authorize-all	Ensure that the AWS Client VPN authorization rules does not authorize connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
1.4.2	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.3	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.
1.4.3	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.3	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	netfw-policy-default-action-full-packets	Ensure that an AWS Network Firewall policy is configured with a user defined default stateless action for full packets. This rule is NON_COMPLIANT if default stateless action for full packets does not match with user defined default stateless action.
1.4.4	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.4	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	redshift-enhanced-vpc-routing-enabled	Ensure that Amazon Redshift clusters have 'enhancedVpcRouting' enabled. The rule is NON_COMPLIANT if 'enhancedVpcRouting' is not enabled or if the configuration.enhancedVpcRouting field is 'false'.
1.4.4	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Control ID	Control Description	AWS Config Rule	Guidance
1.4.5	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	ecs-task-definition-pid-mode-check	Ensure that ECSTaskDefinitions are configured to share a host's process namespace with its Amazon Elastic Container Service (Amazon ECS) containers. The rule is NON_COMPLIANT if the pidMode parameter is set to'host'.
1.4.5	Network connections between trusted and untrusted networks are controlled. (PCI-DSS-v4.0)	ec2-launch-template-public-ip-disabled	Ensure that Amazon EC2 Launch Templates are not set to assign public IP addresses to Network Interfaces. The rule is NON_COMPLIANT if the default version of an EC2 Launch Template has at least 1 Network Interface with 'AssociatePublicIpAddress' set to 'true'.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	cloudfront-associated-with-waf	Ensure that Amazon CloudFront distributions are associated with either web application firewall (WAF) or WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT if a CloudFront distribution is not associated with a WAF web ACL.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	rds-db-security-group-not-allowed	Ensure that the Amazon Relational Database Service (Amazon RDS) DB security groups is the default one. The rule is NON_COMPLIANT if there are any DB security groups that are not the default DB security group.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	ec2-transit-gateway-auto-vpc-attach-disabled	Ensure that Amazon Elastic Compute Cloud (Amazon EC2) Transit Gateways do not have 'AutoAcceptSharedAttachments' enabled. The rule is NON_COMPLIANT for a Transit Gateway if 'AutoAcceptSharedAttachments' is set to 'enable'.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	eks-endpoint-no-public-access	Ensure that the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	restricted-ssh	Note: For this rule, the rule identifie r (INCOMING _SSH_DISABLED) and rule name (restricted-ssh) are different. Ensure that the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	docdb-cluster-snapshot-public-prohibited	Ensure that Amazon DocumentDB manual cluster snapshots are not public. The rule is NON_COMPLIANT if any Amazon DocumentDB manual cluster snapshots are public.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	codebuild-project-source-repo-url-check	Ensure that the Bitbucket source repository URL DOES NOT contain sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	emr-block-public-a ccess	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurit yGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGrou pRuleRanges.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	nacl-no-unrestricted-ssh-rdp	Ensure that default ports for SSH/RDP ingress traffic for network access control lists (NACLs) are restricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	waf-global-webacl-not-empty	Ensure that a WAF Global Web ACL contains some WAF rules or rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rule or rule group.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	waf-global-rulegroup-not-empty	Ensure that an AWS WAF Classic rule group contains some rules. The rule is NON_COMPLIANT if there are no rules present within a rule group.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	waf-global-rule-not-empty	Ensure that an AWS WAF global rule contains some conditions. The rule is NON_COMPLIANT if no conditions are present within the WAF global rule.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	ec2-client-vpn-not-authorize-all	Ensure that the AWS Client VPN authorization rules does not authorize connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Control ID	Control Description	AWS Config Rule	Guidance
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
1.5.1	Risks to the CDE from computing devices that are able to connect to both untrusted networks and the CDE are mitigated. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudfront-accesslogs-enabled	Ensure that Amazon CloudFront distributions are configured to deliver access logs to an Amazon S3 bucket. The rule is NON_COMPLIANT if a CloudFront distribution does not have logging configured.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	waf-classic-logging-enabled	Ensure that logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.2.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudfront-accesslogs-enabled	Ensure that Amazon CloudFront distributions are configured to deliver access logs to an Amazon S3 bucket. The rule is NON_COMPLIANT if a CloudFront distribution does not have logging configured.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	waf-classic-logging-enabled	Ensure that logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.2.1.1	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudfront-accesslogs-enabled	Ensure that Amazon CloudFront distributions are configured to deliver access logs to an Amazon S3 bucket. The rule is NON_COMPLIANT if a CloudFront distribution does not have logging configured.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	waf-classic-logging-enabled	Ensure that logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.2.1.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudfront-accesslogs-enabled	Ensure that Amazon CloudFront distributions are configured to deliver access logs to an Amazon S3 bucket. The rule is NON_COMPLIANT if a CloudFront distribution does not have logging configured.
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	waf-classic-logging-enabled	Ensure that logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.2.1.3	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.2.1.4	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.4	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.2.1.4	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudfront-accesslogs-enabled	Ensure that Amazon CloudFront distributions are configured to deliver access logs to an Amazon S3 bucket. The rule is NON_COMPLIANT if a CloudFront distribution does not have logging configured.
10.2.1.4	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.4	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.2.1.4	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.4	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.4	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.2.1.4	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	waf-classic-logging-enabled	Ensure that logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.
10.2.1.4	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.4	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.6	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.2.1.6	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	waf-classic-logging-enabled	Ensure that logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.
10.2.1.6	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.6	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.
10.2.1.6	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.2.1.6	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.6	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.2.1.6	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudfront-accesslogs-enabled	Ensure that Amazon CloudFront distributions are configured to deliver access logs to an Amazon S3 bucket. The rule is NON_COMPLIANT if a CloudFront distribution does not have logging configured.
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	waf-classic-logging-enabled	Ensure that logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.2.1.7	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudfront-accesslogs-enabled	Ensure that Amazon CloudFront distributions are configured to deliver access logs to an Amazon S3 bucket. The rule is NON_COMPLIANT if a CloudFront distribution does not have logging configured.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	waf-classic-logging-enabled	Ensure that logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.2.2	Audit logs are implemented to support the detection of anomalies and suspicious activity, and the forensic analysis of events. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	cloudfront-accesslogs-enabled	Ensure that Amazon CloudFront distributions are configured to deliver access logs to an Amazon S3 bucket. The rule is NON_COMPLIANT if a CloudFront distribution does not have logging configured.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	waf-classic-logging-enabled	Ensure that logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.3.1	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	cloudtrail-security-trail-enabled	Ensure that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:

Control ID	Control Description	AWS Config Rule	Guidance
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	neptune-cluster-snapshot-public-prohibited	Ensure that an Amazon Neptune manual DB cluster snapshot is not public. The rule is NON_COMPLIANT if any existing and new Neptune cluster snapshot is public.
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	docdb-cluster-snapshot-public-prohibited	Ensure that Amazon DocumentDB manual cluster snapshots are not public. The rule is NON_COMPLIANT if any Amazon DocumentDB manual cluster snapshots are public.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGroupRuleRanges.
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
10.3.2	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	aurora-resources-protected-by-backup-plan	Ensure that Amazon Aurora DB clusters are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon Relational Database Service (Amazon RDS) Database Cluster is not protected by a backup plan.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	db-instance-backup-enabled	Ensure that RDS DB instances have backups enabled. Optionally, the rule checks the backup retention period and the backup window.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	dynamodb-in-backup-plan	Ensure that Amazon DynamoDB tables are present in AWS Backup Plans. The rule is NON_COMPLIANT if Amazon DynamoDB tables are not present in any AWS Backup plan.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	dynamodb-resources-protected-by-backup-plan	Ensure that Amazon DynamoDB tables are protected by a backup plan. The rule is NON_COMPLIANT if the DynamoDB Table is not covered by a backup plan.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	ebs-in-backup-plan	Ensure that Amazon Elastic Block Store (Amazon EBS) volumes are added in backup plans of AWS Backup. The rule is NON_COMPLIANT if Amazon EBS volumes are not included in backup plans.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	ebs-resources-protected-by-backup-plan	Ensure that Amazon Elastic Block Store (Amazon EBS) volumes are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon EBS volume is not covered by a backup plan.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	ec2-resources-protected-by-backup-plan	Ensure that Amazon Elastic Compute Cloud (Amazon EC2) instances are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon EC2 instance is not covered by a backup plan.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	efs-in-backup-plan	Ensure that Amazon Elastic File System (Amazon EFS) file systems are added in the backup plans of AWS Backup. The rule is NON_COMPLIANT if EFS file systems are not included in the backup plans.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	efs-resources-protected-by-backup-plan	Ensure that Amazon Elastic File System (Amazon EFS) file systems are protected by a backup plan. The rule is NON_COMPLIANT if the EFS File System is not covered by a backup plan.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	elasticache-redis-cluster-automatic-backup-check	Check if the Amazon ElastiCache Redis clusters have automatic backup turned on. The rule is NON_COMPLIANT if the SnapshotRetentionLimit for Redis cluster is less than the SnapshotRetentionPeriod parameter. For example: If the parameter is 15 then the rule is non-compliant if the snapshotRetentionPeriod is between 0-15.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	fsx-resources-protected-by-backup-plan	Ensure that Amazon FSx File Systems are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon FSx File System is not covered by a backup plan.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	neptune-cluster-backup-retention-check	Ensure that an Amazon Neptune DB cluster retention period is set to specific number of days. The rule is NON_COMPLIANT if the retention period is less than the value specified by the parameter.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	rds-in-backup-plan	Ensure that Amazon Relational Database Service (Amazon RDS) databases are present in AWS Backup plans. The rule is NON_COMPLIANT if Amazon RDS databases are not included in any AWS Backup plan.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	rds-resources-protected-by-backup-plan	Ensure that Amazon Relational Database Service (Amazon RDS) instances are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon RDS Database instance is not covered by a backup plan.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	redshift-backup-enabled	Ensure that Amazon Redshift automated snapshots are enabled for clusters. The rule is NON_COMPLIANT if the value for automated SnapshotRetentionPeriod is greater than MaxRetentionPeriod or less than MinRetentionPeriod or the value is 0.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	s3-resources-protected-by-backup-plan	Ensure that Amazon Simple Storage Service (Amazon S3) buckets are protected by a backup plan. The rule is NON_COMPLIANT if the Amazon S3 bucket is not covered by a backup plan.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	cloudtrail-security-trail-enabled	Ensure that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	db-instance-backup-enabled	Ensure that RDS DB instances have backups enabled. Optionally, the rule checks the backup retention period and the backup window.
10.3.3	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.
10.3.4	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	cloudfront-origin-access-identity-enabled	Ensure that CloudFront distribution with Amazon S3 Origin type has origin access identity (OAI) configured. The rule is NON_COMPLIANT if the CloudFront distribution is backed by S3 and any origin type is not OAI configured, or the origin is not an S3 bucket.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.4	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	cloudfront-s3-origin-access-control-enabled	Ensure that an Amazon CloudFront distribution with an Amazon Simple Storage Service (Amazon S3) Origin type has origin access control (OAC) enabled. The rule is NON_COMPLIANT for CloudFront distributions with Amazon S3 origins that don't have OAC enabled.
10.3.4	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	s3-bucket-default-lock-enabled	Ensure that the S3 bucket has lock enabled, by default. The rule is NON_COMPLIANT if the lock is not enabled.
10.3.4	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	s3-bucket-versioning-enabled	Ensure that versioning is enabled for your S3 buckets. Optionally, the rule checks if MFA delete is enabled for your S3 buckets.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.4	Audit logs are protected from destruction and unauthorized modifications. (PCI-DSS-v4.0)	cloudtrail-security-trail-enabled	Ensure that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.
10.4.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.1.1	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.
10.4.2	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.4.3	Audit logs are reviewed to identify anomalies or suspicious activity. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.5.1	Audit log history is retained and available for analysis. (PCI-DSS-v4.0)	cloudtrail-security-trail-enabled	Ensure that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:
10.5.1	Audit log history is retained and available for analysis. (PCI-DSS-v4.0)	ec2-volume-inuse-check	Ensure that EBS volumes are attached to EC2 instances. Optionally ensure that EBS volumes are marked for deletion when an instance is terminated.

Control ID	Control Description	AWS Config Rule	Guidance
10.5.1	Audit log history is retained and available for analysis. (PCI-DSS-v4.0)	ecr-private-lifecycle-policy-configured	Ensure that a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repositor y.
10.5.1	Audit log history is retained and available for analysis. (PCI-DSS-v4.0)	dynamodb-pitr-enab led	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.
10.5.1	Audit log history is retained and available for analysis. (PCI-DSS-v4.0)	cw-loggroup-retent ion-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPL IANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	cloudfront-accesslogs-enabled	Ensure that Amazon CloudFront distributions are configured to deliver access logs to an Amazon S3 bucket. The rule is NON_COMPLIANT if a CloudFront distribution does not have logging configured.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissions than the control Amazon S3 bucket policy that you provide.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	waf-classic-logging-enabled	Ensure that logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
10.6.3	Time-synchronization mechanisms support consistent time settings across all systems. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudformation-stack-notification-check	Ensure that your CloudFormation stacks send event notifications to an Amazon SNS topic. Optionally ensure that specified Amazon SNS topics are used. The rule is NON_COMPLIANT if CloudFormation stacks do not send notifications.
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.
10.7.1	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudformation-stack-notification-check	Ensure that your CloudFormation stacks send event notifications to an Amazon SNS topic. Optionally ensure that specified Amazon SNS topics are used. The rule is NON_COMPLIANT if CloudFormation stacks do not send notifications.
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.

Control ID	Control Description	AWS Config Rule	Guidance
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.
10.7.2	Failures of critical security control systems are detected, reported, and responded to promptly. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
11.5.2	Network intrusions and unexpected file changes are detected and responded to. (PCI-DSS-v4.0)	cloudformation-stack-notification-check	Ensure that your CloudFormation stacks send event notifications to an Amazon SNS topic. Optionally ensure that specified Amazon SNS topics are used. The rule is NON_COMPLIANT if CloudFormation stacks do not send notifications.
11.5.2	Network intrusions and unexpected file changes are detected and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
11.5.2	Network intrusions and unexpected file changes are detected and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
11.5.2	Network intrusions and unexpected file changes are detected and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-settings-check	Ensure that CloudWatch alarms with the given metric name have the specified settings.
11.5.2	Network intrusions and unexpected file changes are detected and responded to. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
11.6.1	Unauthorized changes on payment pages are detected and responded to. (PCI-DSS-v4.0)	cloudformation-stack-notification-check	Ensure that your CloudFormation stacks send event notifications to an Amazon SNS topic. Optionally ensure that specified Amazon SNS topics are used. The rule is NON_COMPLIANT if CloudFormation stacks do not send notifications.
11.6.1	Unauthorized changes on payment pages are detected and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
11.6.1	Unauthorized changes on payment pages are detected and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
11.6.1	Unauthorized changes on payment pages are detected and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-settings-check	Ensure that CloudWatch alarms with the given metric name have the specified settings.
11.6.1	Unauthorized changes on payment pages are detected and responded to. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
12.10.5	Suspected and confirmed security incidents that could impact the CDE are responded to immediately. (PCI-DSS-v4.0)	cloudformation-stack-notification-check	Ensure that your CloudFormation stacks send event notifications to an Amazon SNS topic. Optionally ensure that specified Amazon SNS topics are used. The rule is NON_COMPLIANT if CloudFormation stacks do not send notifications.
12.10.5	Suspected and confirmed security incidents that could impact the CDE are responded to immediately. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
12.10.5	Suspected and confirmed security incidents that could impact the CDE are responded to immediately. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
12.10.5	Suspected and confirmed security incidents that could impact the CDE are responded to immediately. (PCI-DSS-v4.0)	cloudwatch-alarm-settings-check	Ensure that CloudWatch alarms with the given metric name have the specified settings.

Control ID	Control Description	AWS Config Rule	Guidance
12.10.5	Suspected and confirmed security incidents that could impact the CDE are responded to immediately. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
12.4.2.1	PCI DSS compliance is managed. (PCI-DSS-v4.0)	service-catalog-shared-within-organization	Ensure that AWS Service Catalog shares portfolios to an organization (a collection of AWS accounts treated as a single unit) when integration is enabled with AWS Organizations. The rule is NON_COMPLIANT if the `Type` value of a share is `ACCOUNT`.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.5	System components are configured and managed securely. (PCI-DSS-v4.0)	cloudfront-security-policy-check	Ensure that Amazon CloudFront distributions are using a minimum security policy and cipher suite of TLSv1.2 or greater for viewer connections. This rule is NON_COMPLIANT for a CloudFront distribution if the minimumProtocolVersion is below TLSv1.2_2018.
2.2.5	System components are configured and managed securely. (PCI-DSS-v4.0)	cloudfront-sni-enabled	Ensure that Amazon CloudFront distributions are using a custom SSL certificate and are configured to use SNI to serve HTTPS requests. The rule is NON_COMPLIANT if a custom SSL certificate is associated but the SSL support method is a dedicated IP address.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.5	System components are configured and managed securely. (PCI-DSS-v4.0)	transfer-family-server-no-ftp	Ensure that a server created with AWS Transfer Family does not use FTP for endpoint connection. The rule is NON_COMPLIANT if the server protocol for endpoint connection is FTP-enabled.
2.2.5	System components are configured and managed securely. (PCI-DSS-v4.0)	cloudfront-no-deprecated-ssl-protocols	Ensure that CloudFront distributions are not using deprecated SSL protocols for HTTPS communication between CloudFront edge locations and custom origins. This rule is NON_COMPLIANT for a CloudFront distribution if any'OriginSslProtocols' includes'SSLv3'.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.5	System components are configured and managed securely. (PCI-DSS-v4.0)	cloudfront-traffic-to-origin-encrypted	Ensure that Amazon CloudFront distributions are encrypting traffic to custom origins. The rule is NON_COMPLIANT if'OriginProtocolPolicy' is'http-only' or if'OriginProtocolPolicy' is'match-viewer' and'ViewerProtocolPolicy' is'allow-all'.
2.2.5	System components are configured and managed securely. (PCI-DSS-v4.0)	cloudfront-viewer-policy-https	Ensure that your Amazon CloudFront distributions use HTTPS (directly or via a redirection). The rule is NON_COMPLIANT if the value of ViewerProtocolPolicy is set to 'allow-all' for the DefaultCacheBehavior or for the CacheBehaviors.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.7	System components are configured and managed securely. (PCI-DSS-v4.0)	dms-redis-tls-enabled	Ensure that AWS Database Migration Service (AWS DMS) endpoints for Redis data stores are enabled for TLS/SSL encryption of data communicated with other endpoints. The rule is NON_COMPLIANT if TLS/SSL encryption is not enabled.
2.2.7	System components are configured and managed securely. (PCI-DSS-v4.0)	cloudfront-no-deprecated-ssl-protocols	Ensure that CloudFront distributions are not using deprecated SSL protocols for HTTPS communication between CloudFront edge locations and custom origins. This rule is NON_COMPLIANT for a CloudFront distribution if any'OriginSslProtocols' includes'SSLv3'.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.7	System components are configured and managed securely. (PCI-DSS-v4.0)	cloudfront-traffic-to-origin-encrypted	Ensure that Amazon CloudFront distributions are encrypting traffic to custom origins. The rule is NON_COMPLIANT if'OriginProtocolPolicy' is'http-only' or if'OriginProtocolPolicy' is'match-viewer' and'ViewerProtocolPolicy' is'allow-all'.
2.2.7	System components are configured and managed securely. (PCI-DSS-v4.0)	cloudfront-viewer-policy-https	Ensure that your Amazon CloudFront distributions use HTTPS (directly or via a redirection). The rule is NON_COMPLIANT if the value of ViewerProtocolPolicy is set to 'allow-all' for the DefaultCacheBehavior or for the CacheBehaviors.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.7	System components are configured and managed securely. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.
2.2.7	System components are configured and managed securely. (PCI-DSS-v4.0)	dax-tls-endpoint-encryption	Ensure that your Amazon DynamoDB Accelerator (DAX) cluster has ClusterEndpointEncryptionType set to TLS. The rule is NON_COMPLIANT if a DAX cluster is not encrypted by transport layer security (TLS).

Control ID	Control Description	AWS Config Rule	Guidance
2.2.7	System components are configured and managed securely. (PCI-DSS-v4.0)	msk-in-cluster-node-require-tls	Ensure that an Amazon MSK cluster enforces encryption in transit using HTTPS (TLS) with the broker nodes of the cluster. The rule is NON_COMPLIANT if plain text communication is enabled for in-cluster broker node connections.
2.2.7	System components are configured and managed securely. (PCI-DSS-v4.0)	dms-endpoint-ssl-configured	Ensure that AWS Database Migration Service (AWS DMS) endpoints are configured with an SSL connection. The rule is NON_COMPLIANT if AWS DMS does not have an SSL connection configured.
3.2.1	Storage of account data is kept to a minimum. (PCI-DSS-v4.0)	ec2-volume-inuse-check	Ensure that EBS volumes are attached to EC2 instances. Optionally ensure that EBS volumes are marked for deletion when an instance is terminated.

Control ID	Control Description	AWS Config Rule	Guidance
3.2.1	Storage of account data is kept to a minimum. (PCI-DSS-v4.0)	ecr-private-lifecycle-policy-configured	Ensure that a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repositor y.
3.2.1	Storage of account data is kept to a minimum. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.
3.2.1	Storage of account data is kept to a minimum. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPL IANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1.1	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ec2-volume-inuse-check	Ensure that EBS volumes are attached to EC2 instances. Optionally ensure that EBS volumes are marked for deletion when an instance is terminated.
3.3.1.1	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ecr-private-lifecycle-policy-configured	Ensure that a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repository.
3.3.1.1	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1.1	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPLIANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.
3.3.1.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ec2-volume-inuse-check	Ensure that EBS volumes are attached to EC2 instances. Optionally ensure that EBS volumes are marked for deletion when an instance is terminated.
3.3.1.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ecr-private-lifecycle-policy-configured	Ensure that a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repository.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.
3.3.1.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPLIANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.
3.3.2	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ec2-volume-inuse-check	Ensure that EBS volumes are attached to EC2 instances. Optionally ensure that EBS volumes are marked for deletion when an instance is terminated.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.2	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ecr-private-lifecycle-policy-configured	Ensure that a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repository.
3.3.2	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.
3.3.2	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPLIANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ec2-volume-inuse-check	Ensure that EBS volumes are attached to EC2 instances. Optionally ensure that EBS volumes are marked for deletion when an instance is terminated.
3.3.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	ecr-private-lifecycle-policy-configured	Ensure that a private Amazon Elastic Container Registry (ECR) repository has at least one lifecycle policy configured. The rule is NON_COMPLIANT if no lifecycle policy is configured for the ECR private repository.
3.3.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	dynamodb-pitr-enabled	Ensure that point-in-time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON_COMPLIANT if PITR is not enabled for DynamoDB tables.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.3	Sensitive authentication data (SAD) is not stored after authorization. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPLIANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	athena-workgroup-encrypted-at-rest	Ensure that an Amazon Athena workgroup is encrypted at rest. The rule is NON_COMPLIANT if encryption of data at rest is not enabled for an Athena workgroup.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	neptune-cluster-snapshot-encrypted	Ensure that an Amazon Neptune DB cluster has snapshots encrypted. The rule is NON_COMPLIANT if a Neptune cluster does not have snapshots encrypted.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	redshift-cluster-kms-enabled	Ensure that Amazon Redshift clusters are using a specified AWS Key Management Service (AWS KMS) key for encryptio n. The rule is COMPLIANT if encryption is enabled and the cluster is encrypted with the key provided in the kmsKeyArn parameter. The rule is NON_COMPL IANT if the cluster is not encrypted or encrypted with another key.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	codebuild-project-artifact-encryption	Ensure that an AWS CodeBuild project has encryption enabled for all of its artifacts. The rule is NON_COMPLIANT if 'encryptionDisabled' is set to 'true' for any primary or secondary (if present) artifact configurations.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	codebuild-project-s3-logs-encrypted	Ensure that an AWS CodeBuild project configured with Amazon S3 Logs has encryption enabled for its logs. The rule is NON_COMPLIANT if'encryptionDisabled' is set to'true' in a S3LogsConfig of a CodeBuild project.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	dax-encryption-enabled	Ensure that Amazon DynamoDB Accelerator (DAX) clusters are encrypted. The rule is NON_COMPLIANT if a DAX cluster is not encrypted.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	eks-secrets-encrypted	Ensure that Amazon Elastic Kubernetes Service clusters are configured to have Kubernetes secrets encrypted using AWS Key Management Service (KMS) keys.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	api-gw-cache-enabled-and-encrypted	Ensure that all methods in Amazon API Gateway stages have cache enabled and cache encrypted. The rule is NON_COMPLIANT if any method in an Amazon API Gateway stage is not configured to cache or the cache is not encrypted.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	docdb-cluster-encrypted	Ensure that storage encryption is enabled for your Amazon DocumentDB (with MongoDB compatibility) clusters. The rule is NON_COMPLIANT if storage encryption is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	dynamodb-table-encrypted-kms	Ensure that Amazon DynamoDB table is encrypted with AWS Key Management Service (KMS). The rule is NON_COMPLIANT if Amazon DynamoDB table is not encrypted with AWS KMS. The rule is also NON_COMPLIANT if the encrypted AWS KMS key is not present in kmsKeyArns input parameter.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	dynamodb-table-encryption-enabled	Ensure that the Amazon DynamoDB tables are encrypted and checks their status. The rule is COMPLIANT if the status is enabled or enabling.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	codebuild-project-envvar-awscred-check	Ensure that the project DOES NOT contain environment variables AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY. The rule is NON_COMPLIANT when the project environment variables contains plaintext credentials.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	eks-cluster-secrets-encrypted	Ensure that Amazon EKS clusters are not configured to have Kubernetes secrets encrypted using AWS KMS. The rule is NON_COMPLIANT if an EKS cluster does not have an encryptionConfig resource or if encryptionConfig does not name secrets as a resource.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	kinesis-stream-encrypted	Ensure that Amazon Kinesis streams are encrypted at rest with server-side encryption. The rule is NON_COMPLIANT for a Kinesis stream if 'StreamEncryption' is not present.
3.5.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	neptune-cluster-encrypted	Ensure that storage encryption is enabled for your Amazon Neptune DB clusters. The rule is NON_COMPLIANT if storage encryption is not enabled.
3.5.1.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.
3.5.1.1	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	neptune-cluster-snapshot-public-prohibited	Ensure that an Amazon Neptune manual DB cluster snapshot is not public. The rule is NON_COMPLIANT if any existing and new Neptune cluster snapshot is public.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	docdb-cluster-snapshot-public-prohibited	Ensure that Amazon DocumentDB manual cluster snapshots are not public. The rule is NON_COMPLIANT if any Amazon DocumentDB manual cluster snapshots are public.
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in PermittedPublicSecurityGroupRuleRanges.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
3.5.1.3	Primary account number (PAN) is secured wherever it is stored. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
3.6.1	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
3.6.1.2	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	acm-pca-root-ca-di sabled	Ensure that AWS Private Certifica te Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1.2	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.
3.6.1.2	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1.3	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
3.6.1.3	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1.3	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.
3.6.1.4	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1.4	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.
3.6.1.4	Cryptographic keys used to protect stored account data are secured. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.1	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	acm-certificate-rsa-check	Ensure that RSA certificates managed by AWS Certificate Manager (ACM) have a key length of at least '2048' bits.The rule is NON_COMPL IANT if the minimum key length is less than 2048 bits.
3.7.1	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	acm-pca-root-ca-di sabled	Ensure that AWS Private Certifica te Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
3.7.1	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associate d with an Amazon CloudFront distribut ion is not the default SSL certificate. The rule is NON_COMPL IANT if a CloudFront distribution uses the default SSL certifica te.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.1	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
3.7.2	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	acm-pca-root-ca-di sabled	Ensure that AWS Private Certifica te Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.2	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associate d with an Amazon CloudFront distribut ion is not the default SSL certificate. The rule is NON_COMPL IANT if a CloudFront distribution uses the default SSL certifica te.
3.7.2	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.4	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	acm-pca-root-ca-di sabled	Ensure that AWS Private Certifica te Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
3.7.4	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associate d with an Amazon CloudFront distribut ion is not the default SSL certificate. The rule is NON_COMPL IANT if a CloudFront distribution uses the default SSL certifica te.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.4	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
3.7.6	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	acm-pca-root-ca-di sabled	Ensure that AWS Private Certifica te Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.6	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associate d with an Amazon CloudFront distribut ion is not the default SSL certificate. The rule is NON_COMPL IANT if a CloudFront distribution uses the default SSL certifica te.
3.7.6	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.7	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	acm-pca-root-ca-di sabled	Ensure that AWS Private Certifica te Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
3.7.7	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associate d with an Amazon CloudFront distribut ion is not the default SSL certificate. The rule is NON_COMPL IANT if a CloudFront distribution uses the default SSL certifica te.

Control ID	Control Description	AWS Config Rule	Guidance
3.7.7	Where cryptography is used to protect stored account data, key managemen t processes and procedures covering all aspects of the key lifecycle are defined and implemented. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
4.2.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	dms-redis-tls-enab led	Ensure that AWS Database Migration Service (AWS DMS) endpoints for Redis data stores are enabled for TLS/SSL encryption of data communicated with other endpoints. The rule is NON_COMPL IANT if TLS/SSL encryption is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
4.2.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	cloudfront-no-deprecated-ssl-protocols	Ensure that CloudFront distributions are not using deprecated SSL protocols for HTTPS communication between CloudFront edge locations and custom origins. This rule is NON_COMPLIANT for a CloudFront distribution if any'OriginSslProtocols' includes'SSLv3'.
4.2.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	cloudfront-traffic-to-origin-encrypted	Ensure that Amazon CloudFront distributions are encrypting traffic to custom origins. The rule is NON_COMPLIANT if'OriginProtocolPolicy' is'http-only' or if'OriginProtocolPolicy' is'match-viewer' and'ViewerProtocolPolicy' is'allow-all'.

Control ID	Control Description	AWS Config Rule	Guidance
4.2.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	cloudfront-viewer-policy-https	Ensure that your Amazon CloudFront distributions use HTTPS (directly or via a redirection). The rule is NON_COMPLIANT if the value of ViewerProtocolPolicy is set to 'allow-all' for the DefaultCacheBehavior or for the CacheBehaviors.
4.2.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

Control ID	Control Description	AWS Config Rule	Guidance
4.2.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	dax-tls-endpoint-encryption	Ensure that your Amazon DynamoDB Accelerator (DAX) cluster has ClusterEndpointEncryptionType set to TLS. The rule is NON_COMPLIANT if a DAX cluster is not encrypted by transport layer security (TLS).
4.2.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	msk-in-cluster-node-require-tls	Ensure that an Amazon MSK cluster enforces encryption in transit using HTTPS (TLS) with the broker nodes of the cluster. The rule is NON_COMPLIANT if plain text communication is enabled for in-cluster broker node connections.

Control ID	Control Description	AWS Config Rule	Guidance
4.2.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	dms-endpoint-ssl-configured	Ensure that AWS Database Migration Service (AWS DMS) endpoints are configured with an SSL connection. The rule is NON_COMPLIANT if AWS DMS does not have an SSL connection configured.
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	acm-pca-root-ca-disabled	Ensure that AWS Private Certificate Authority (AWS Private CA) has a root CA that is disabled. The rule is NON_COMPLIANT for root CAs with status that is not DISABLED.
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.

Control ID	Control Description	AWS Config Rule	Guidance
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	dms-redis-tls-enabled	Ensure that AWS Database Migration Service (AWS DMS) endpoints for Redis data stores are enabled for TLS/SSL encryption of data communicated with other endpoints. The rule is NON_COMPLIANT if TLS/SSL encryption is not enabled.
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	cloudfront-no-deprecated-ssl-protocols	Ensure that CloudFront distributions are not using deprecated SSL protocols for HTTPS communication between CloudFront edge locations and custom origins. This rule is NON_COMPLIANT for a CloudFront distribution if any'OriginSslProtocols' includes'SSLv3'.

Control ID	Control Description	AWS Config Rule	Guidance
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	cloudfront-traffic-to-origin-encrypted	Ensure that Amazon CloudFront distributions are encrypting traffic to custom origins. The rule is NON_COMPLIANT if'OriginProtocolPolicy' is'http-only' or if'OriginProtocolPolicy' is'match-viewer' and'ViewerProtocolPolicy' is'allow-all'.
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	cloudfront-viewer-policy-https	Ensure that your Amazon CloudFront distributions use HTTPS (directly or via a redirection). The rule is NON_COMPLIANT if the value of ViewerProtocolPolicy is set to 'allow-all' for the DefaultCacheBehavior or for the CacheBehaviors.

Control ID	Control Description	AWS Config Rule	Guidance
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	dax-tls-endpoint-e ncryption	Ensure that your Amazon DynamoDB Accelerator (DAX) cluster has ClusterEn dpointEncryptionTy pe set to TLS. The rule is NON_COMPL IANT if a DAX cluster is not encrypted by transport layer security (TLS).

Control ID	Control Description	AWS Config Rule	Guidance
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	msk-in-cluster-node-require-tls	Ensure that an Amazon MSK cluster enforces encryption in transit using HTTPS (TLS) with the broker nodes of the cluster. The rule is NON_COMPLIANT if plain text communication is enabled for in-cluster broker node connections.
4.2.1.1	PAN is protected with strong cryptography during transmission. (PCI-DSS-v4.0)	dms-endpoint-ssl-configured	Ensure that AWS Database Migration Service (AWS DMS) endpoints are configured with an SSL connection. The rule is NON_COMPLIANT if AWS DMS does not have an SSL connection configured.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	cloudfront-accesslogs-enabled	Ensure that Amazon CloudFront distributions are configured to deliver access logs to an Amazon S3 bucket. The rule is NON_COMPLIANT if a CloudFront distribution does not have logging configured.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	cloudtrail-security-trail-enabled	Ensure that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	waf-classic-logging-enabled	Ensure that logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.

Control ID	Control Description	AWS Config Rule	Guidance
5.3.4	Anti-malware mechanisms and processes are active, maintained, and monitored. (PCI-DSS-v4.0)	cw-loggroup-retention-period-check	Ensure that an Amazon CloudWatch LogGroup retention period is set to greater than 365 days or else a specified retention period. The rule is NON_COMPLIANT if the retention period is less than MinRetentionTime, if specified, or else 365 days.
6.3.3	Security vulnerabilities are identified and addressed. (PCI-DSS-v4.0)	lambda-function-settings-check	Ensure that the AWS Lambda function settings for runtime, role, timeout, and memory size match the expected values. The rule ignores functions with the 'Image' package type and functions with runtime set to 'OS-only Runtime'. The rule is NON_COMPLIANT if the Lambda function settings do not match the expected values.

Control ID	Control Description	AWS Config Rule	Guidance
6.3.3	Security vulnerabilities are identified and addressed. (PCI-DSS-v4.0)	eks-cluster-oldest-supported-version	Ensure that an Amazon Elastic Kubernetes Service (EKS) cluster is not running the oldest supported version. The rule is NON_COMPLIANT if an EKS cluster is running oldest supported version (equal to the parameter 'oldestVersionSupported').
6.4.1	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	cloudfront-associated-with-waf	Ensure that Amazon CloudFront distributions are associated with either web application firewall (WAF) or WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT if a CloudFront distribution is not associated with a WAF web ACL.

Control ID	Control Description	AWS Config Rule	Guidance
6.4.1	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.
6.4.1	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	wafv2-webacl-not-empty	Ensure that a WAFv2 Web ACL contains any WAF rules or WAF rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rules or WAF rule groups.
6.4.1	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	wafv2-rulegroup-not-empty	Ensure that WAFv2 Rule Groups contain rules. The rule is NON_COMPLIANT if there are no rules in a WAFv2 Rule Group.

Control ID	Control Description	AWS Config Rule	Guidance
6.4.1	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	waf-global-webacl-not-empty	Ensure that a WAF Global Web ACL contains some WAF rules or rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rule or rule group.
6.4.1	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	waf-global-rulegroup-not-empty	Ensure that an AWS WAF Classic rule group contains some rules. The rule is NON_COMPLIANT if there are no rules present within a rule group.
6.4.1	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	waf-global-rulegroup-not-empty	Ensure that an AWS WAF Classic rule group contains some rules. The rule is NON_COMPLIANT if there are no rules present within a rule group.

Control ID	Control Description	AWS Config Rule	Guidance
6.4.1	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	waf-global-rule-not-empty	Ensure that an AWS WAF global rule contains some conditions. The rule is NON_COMPLIANT if no conditions are present within the WAF global rule.
6.4.2	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	cloudfront-associated-with-waf	Ensure that Amazon CloudFront distributions are associated with either web application firewall (WAF) or WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT if a CloudFront distribution is not associated with a WAF web ACL.
6.4.2	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.

Control ID	Control Description	AWS Config Rule	Guidance
6.4.2	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	wafv2-webacl-not-empty	Ensure that a WAFv2 Web ACL contains any WAF rules or WAF rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rules or WAF rule groups.
6.4.2	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	wafv2-rulegroup-not-empty	Ensure that WAFv2 Rule Groups contain rules. The rule is NON_COMPLIANT if there are no rules in a WAFv2 Rule Group.
6.4.2	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	waf-global-webacl-not-empty	Ensure that a WAF Global Web ACL contains some WAF rules or rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rule or rule group.
6.4.2	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	waf-global-rulegroup-not-empty	Ensure that an AWS WAF Classic rule group contains some rules. The rule is NON_COMPLIANT if there are no rules present within a rule group.

Control ID	Control Description	AWS Config Rule	Guidance
6.4.2	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	waf-global-rulegroup-not-empty	Ensure that an AWS WAF Classic rule group contains some rules. The rule is NON_COMPLIANT if there are no rules present within a rule group.
6.4.2	Public-facing web applications are protected against attacks. (PCI-DSS-v4.0)	waf-global-rule-not-empty	Ensure that an AWS WAF global rule contains some conditions. The rule is NON_COMPLIANT if no conditions are present within the WAF global rule.
6.5.5	Changes to all system components are managed securely. (PCI-DSS-v4.0)	codedeploy-lambda-allatonce-traffic-shift-disabled	Ensure that the deployment group for Lambda Compute Platform is not using the default deployment configuration. The rule is NON_COMPLIANT if the deployment group is using the deployment configuration 'CodeDeployDefault.LambdaAllAtOnce'.

Control ID	Control Description	AWS Config Rule	Guidance
6.5.5	Changes to all system components are managed securely. (PCI-DSS-v4.0)	codepipeline-deployment-count-check	Ensure that the first deployment stage of AWS CodePipeline performs at least one deployment. This is to monitor continuous deployment activity, ensuring regular updates and identifying inactive or underutilized pipelines, which can signal issues in the development or deployment process. Optionally ensure that each of the subsequent remaining stages deploy to more than the specified number of deployments (deploymentLimit).

Control ID	Control Description	AWS Config Rule	Guidance
6.5.6	Changes to all system components are managed securely. (PCI-DSS-v4.0)	codedeploy-lambda-allatonce-traffic-shift-disabled	Ensure that the deployment group for Lambda Compute Platform is not using the default deployment configuration. The rule is NON_COMPLIANT if the deployment group is using the deployment configuration 'CodeDeployDefault.LambdaAllAtOnce'.

Control ID	Control Description	AWS Config Rule	Guidance
6.5.6	Changes to all system components are managed securely. (PCI-DSS-v4.0)	codepipeline-deployment-count-check	Ensure that the first deployment stage of AWS CodePipeline performs at least one deployment. This is to monitor continuous deployment activity, ensuring regular updates and identifying inactive or underutilized pipelines, which can signal issues in the development or deployment process. Optionally ensure that each of the subsequent remaining stages deploy to more than the specified number of deployments (deploymentLimit).

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	shield-drt-access	Ensure that the Shield Response Team (SRT) can access your AWS account. The rule is NON_COMPLIANT if AWS Shield Advanced is enabled but the role for SRT access is not configured.
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	rds-cluster-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) cluster has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS Cluster does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
7.2.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	rds-instance-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) instance has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS instance does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	shield-drt-access	Ensure that the Shield Response Team (SRT) can access your AWS account. The rule is NON_COMPLIANT if AWS Shield Advanced is enabled but the role for SRT access is not configured.
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	rds-cluster-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) cluster has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS Cluster does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
7.2.2	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	rds-instance-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) instance has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS instance does not have IAM authentication enabled.
7.2.4	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	secretsmanager-secret-unused	Ensure that AWS Secrets Manager secrets have been accessed within a specified number of days. The rule is NON_COMPLIANT if a secret has not been accessed in 'unusedForDays' number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	shield-drt-access	Ensure that the Shield Response Team (SRT) can access your AWS account. The rule is NON_COMPLIANT if AWS Shield Advanced is enabled but the role for SRT access is not configured.
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	rds-cluster-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) cluster has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS Cluster does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
7.2.5	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	rds-instance-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) instance has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS instance does not have IAM authentication enabled.
7.2.5.1	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	secretsmanager-secret-unused	Ensure that AWS Secrets Manager secrets have been accessed within a specified number of days. The rule is NON_COMPLIANT if a secret has not been accessed in 'unusedForDays' number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.6	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.2.6	Access to system components and data is appropriately defined and assigned. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	shield-drt-access	Ensure that the Shield Response Team (SRT) can access your AWS account. The rule is NON_COMPLIANT if AWS Shield Advanced is enabled but the role for SRT access is not configured.
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	rds-cluster-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) cluster has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS Cluster does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
7.3.1	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	rds-instance-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) instance has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS instance does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	shield-drt-access	Ensure that the Shield Response Team (SRT) can access your AWS account. The rule is NON_COMPLIANT if AWS Shield Advanced is enabled but the role for SRT access is not configured.
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	rds-cluster-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) cluster has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS Cluster does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
7.3.2	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	rds-instance-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) instance has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS instance does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissio ns than the control Amazon S3 bucket policy that you provide.
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	shield-drt-access	Ensure that the Shield Response Team (SRT) can access your AWS account. The rule is NON_COMPLIANT if AWS Shield Advanced is enabled but the role for SRT access is not configured.
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	rds-cluster-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) cluster has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS Cluster does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
7.3.3	Access to system components and data is managed via an access control system(s). (PCI-DSS-v4.0)	rds-instance-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) instance has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS instance does not have IAM authentication enabled.
8.2.1	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
8.2.1	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-no-amazon-key-pair	Ensure that running Amazon Elastic Compute Cloud (EC2) instances are not launched using amazon key pairs. The rule is NON_COMPLIANT if a running EC2 instance is launched with a key pair.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.2	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
8.2.2	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-no-amazon-key-pair	Ensure that running Amazon Elastic Compute Cloud (EC2) instances are not launched using amazon key pairs. The rule is NON_COMPLIANT if a running EC2 instance is launched with a key pair.
8.2.2	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	codebuild-project-envvar-awscred-check	Ensure that the project DOES NOT contain environment variables AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY. The rule is NON_COMPLIANT when the project environment variables contains plaintext credentials.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.2	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	secretsmanager-scheduled-rotation-success-check	Ensure that AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.
8.2.2	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	secretsmanager-secret-periodic-rotation	Ensure that AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.2	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	secretsmanager-secret-unused	Ensure that AWS Secrets Manager secrets have been accessed within a specified number of days. The rule is NON_COMPLIANT if a secret has not been accessed in 'unusedForDays' number of days. The default value is 90 days.
8.2.4	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
8.2.4	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-no-amazon-key-pair	Ensure that running Amazon Elastic Compute Cloud (EC2) instances are not launched using amazon key pairs. The rule is NON_COMPLIANT if a running EC2 instance is launched with a key pair.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.5	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
8.2.5	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-no-amazon-key-pair	Ensure that running Amazon Elastic Compute Cloud (EC2) instances are not launched using amazon key pairs. The rule is NON_COMPLIANT if a running EC2 instance is launched with a key pair.
8.2.6	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	secretsmanager-secret-unused	Ensure that AWS Secrets Manager secrets have been accessed within a specified number of days. The rule is NON_COMPLIANT if a secret has not been accessed in 'unusedForDays' number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissions than the control Amazon S3 bucket policy that you provide.
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	shield-drt-access	Ensure that the Shield Response Team (SRT) can access your AWS account. The rule is NON_COMPLIANT if AWS Shield Advanced is enabled but the role for SRT access is not configured.
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	rds-cluster-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) cluster has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS Cluster does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
8.2.7	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	rds-instance-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) instance has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS instance does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissions than the control Amazon S3 bucket policy that you provide.
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	shield-drt-access	Ensure that the Shield Response Team (SRT) can access your AWS account. The rule is NON_COMPLIANT if AWS Shield Advanced is enabled but the role for SRT access is not configured.
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	rds-cluster-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) cluster has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS Cluster does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-imdsv2-check	Ensure that your Amazon Elastic Compute Cloud (Amazon EC2) instance metadata version is configured with Instance Metadata Service Version 2 (IMDSv2). The rule is NON_COMPLIANT if the HttpTokens is set to optional.
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	autoscaling-launchconfig-requires-imdsv2	Ensure that only IMDSv2 is enabled. This rule is NON_COMPLIANT if the Metadata version is not included in the launch configuration or if both Metadata V1 and V2 are enabled.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
8.2.8	User identification and related accounts for users and administrators are strictly managed throughout an accounts lifecycle. (PCI-DSS-v4.0)	rds-instance-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) instance has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS instance does not have IAM authentication enabled.
8.3.10.1	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	access-keys-rotated	Ensure that active IAM access keys are rotated (changed) within the number of days specified in maxAccessKeyAge. The rule is NON_COMPLIANT if access keys are not rotated within the specified time period. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.10.1	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-scheduled-rotation-success-check	Ensure that AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.
8.3.10.1	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-secret-periodic-rotation	Ensure that AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.11	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.
8.3.11	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	ec2-no-amazon-key-pair	Ensure that running Amazon Elastic Compute Cloud (EC2) instances are not launched using amazon key pairs. The rule is NON_COMPLIANT if a running EC2 instance is launched with a key pair.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	athena-workgroup-encrypted-at-rest	Ensure that an Amazon Athena workgroup is encrypted at rest. The rule is NON_COMPLIANT if encryption of data at rest is not enabled for an Athena workgroup.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentic ation for users and administrators is established and managed. (PCI-DSS-v4.0)	neptune-cluster-snapshot-encrypted	Ensure that an Amazon Neptune DB cluster has snapshots encrypted. The rule is NON_COMPLIANT if a Neptune cluster does not have snapshots encrypted.
8.3.2	Strong authentic ation for users and administrators is established and managed. (PCI-DSS-v4.0)	redshift-cluster-kms-enabled	Ensure that Amazon Redshift clusters are using a specified AWS Key Management Service (AWS KMS) key for encryptio n. The rule is COMPLIANT if encryption is enabled and the cluster is encrypted with the key provided in the kmsKeyArn parameter. The rule is NON_COMPL IANT if the cluster is not encrypted or encrypted with another key.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	codebuild-project-artifact-encryption	Ensure that an AWS CodeBuild project has encryption enabled for all of its artifacts. The rule is NON_COMPLIANT if 'encryptionDisabled' is set to 'true' for any primary or secondary (if present) artifact configurations.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	codebuild-project-s3-logs-encrypted	Ensure that an AWS CodeBuild project configured with Amazon S3 Logs has encryption enabled for its logs. The rule is NON_COMPLIANT if'encryptionDisabled' is set to'true' in a S3LogsConfig of a CodeBuild project.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	dax-encryption-enabled	Ensure that Amazon DynamoDB Accelerator (DAX) clusters are encrypted. The rule is NON_COMPLIANT if a DAX cluster is not encrypted.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	dms-redis-tls-enabled	Ensure that AWS Database Migration Service (AWS DMS) endpoints for Redis data stores are enabled for TLS/SSL encryption of data communicated with other endpoints. The rule is NON_COMPLIANT if TLS/SSL encryption is not enabled.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	eks-secrets-encrypted	Ensure that Amazon Elastic Kubernetes Service clusters are configured to have Kubernetes secrets encrypted using AWS Key Management Service (KMS) keys.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	api-gw-cache-enabled-and-encrypted	Ensure that all methods in Amazon API Gateway stages have cache enabled and cache encrypted. The rule is NON_COMPLIANT if any method in an Amazon API Gateway stage is not configured to cache or the cache is not encrypted.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	docdb-cluster-encrypted	Ensure that storage encryption is enabled for your Amazon DocumentDB (with MongoDB compatibility) clusters. The rule is NON_COMPLIANT if storage encryption is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	dynamodb-table-encrypted-kms	Ensure that Amazon DynamoDB table is encrypted with AWS Key Management Service (KMS). The rule is NON_COMPLIANT if Amazon DynamoDB table is not encrypted with AWS KMS. The rule is also NON_COMPLIANT if the encrypted AWS KMS key is not present in kmsKeyArns input parameter.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	dynamodb-table-encryption-enabled	Ensure that the Amazon DynamoDB tables are encrypted and checks their status. The rule is COMPLIANT if the status is enabled or enabling.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	cloudfront-no-deprecated-ssl-protocols	Ensure that CloudFront distributions are not using deprecated SSL protocols for HTTPS communication between CloudFront edge locations and custom origins. This rule is NON_COMPLIANT for a CloudFront distribution if any'OriginSslProtocols' includes'SSLv3'.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	cloudfront-traffic-to-origin-encrypted	Ensure that Amazon CloudFront distributions are encrypting traffic to custom origins. The rule is NON_COMPLIANT if'OriginProtocolPolicy' is'http-only' or if'OriginProtocolPolicy' is'match-viewer' and'ViewerProtocolPolicy' is'allow-all'.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	cloudfront-viewer-policy-https	Ensure that your Amazon CloudFront distributions use HTTPS (directly or via a redirection). The rule is NON_COMPLIANT if the value of ViewerProtocolPolicy is set to 'allow-all' for the DefaultCacheBehavior or for the CacheBehaviors.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	codebuild-project-envvar-awscred-check	Ensure that the project DOES NOT contain environment variables AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY. The rule is NON_COMPLIANT when the project environment variables contains plaintext credentials.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	dax-tls-endpoint-encryption	Ensure that your Amazon DynamoDB Accelerator (DAX) cluster has ClusterEndpointEncryptionType set to TLS. The rule is NON_COMPLIANT if a DAX cluster is not encrypted by transport layer security (TLS).

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentic ation for users and administrators is established and managed. (PCI-DSS-v4.0)	eks-cluster-secrets-encrypted	Ensure that Amazon EKS clusters are not configured to have Kubernetes secrets encrypted using AWS KMS. The rule is NON_COMPLIANT if an EKS cluster does not have an encryptio nConfig resource or if encryptionConfig does not name secrets as a resource.
8.3.2	Strong authentic ation for users and administrators is established and managed. (PCI-DSS-v4.0)	kinesis-stream-enc rypted	Ensure that Amazon Kinesis streams are encrypted at rest with server-side encryption. The rule is NON_COMPLIANT for a Kinesis stream if 'StreamEncryption' is not present.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	msk-in-cluster-node-require-tls	Ensure that an Amazon MSK cluster enforces encryption in transit using HTTPS (TLS) with the broker nodes of the cluster. The rule is NON_COMPLIANT if plain text communication is enabled for in-cluster broker node connections.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	neptune-cluster-encrypted	Ensure that storage encryption is enabled for your Amazon Neptune DB clusters. The rule is NON_COMPLIANT if storage encryption is not enabled.
8.3.2	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	dms-endpoint-ssl-configured	Ensure that AWS Database Migration Service (AWS DMS) endpoints are configured with an SSL connection. The rule is NON_COMPLIANT if AWS DMS does not have an SSL connection configured.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	s3-bucket-blacklisted-actions-prohibited	Ensure that an Amazon Simple Storage Service (Amazon S3) bucket policy does not allow blocklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket* actions and s3:DeleteObject on any object in the bucket. The rule is NON_COMPLIANT if any blocklisted actions are allowed by the Amazon S3 bucket policy.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	s3-bucket-policy-not-more-permissive	Ensure that your Amazon Simple Storage Service (S3) bucket policies do not allow other inter-account permissions than the control Amazon S3 bucket policy that you provide.
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	shield-drt-access	Ensure that the Shield Response Team (SRT) can access your AWS account. The rule is NON_COMPLIANT if AWS Shield Advanced is enabled but the role for SRT access is not configured.
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	iam-policy-in-use	Ensure that an IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	neptune-cluster-iam-database-authentication	Ensure that an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled. The rule is NON_COMPLIANT if an Amazon Neptune cluster does not have IAM database authentication enabled.
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	rds-cluster-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) cluster has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS Cluster does not have IAM authentication enabled.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	ec2-instance-profile-attached	Ensure that an EC2 instance has an AWS Identity and Access Management (IAM) profile attached to it. The rule is NON_COMPLIANT if no IAM profile is attached to the EC2 instance.
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
8.3.4	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	rds-instance-iam-authentication-enabled	Ensure that an Amazon Relational Database Service (Amazon RDS) instance has AWS Identity and Access Management (IAM) authentication enabled. The rule is NON_COMPLIANT if an Amazon RDS instance does not have IAM authentication enabled.
8.3.5	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	access-keys-rotated	Ensure that active IAM access keys are rotated (changed) within the number of days specified in maxAccessKeyAge. The rule is NON_COMPLIANT if access keys are not rotated within the specified time period. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.5	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-scheduled-rotation-success-check	Ensure that AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.
8.3.5	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-secret-periodic-rotation	Ensure that AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.7	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	access-keys-rotated	Ensure that active IAM access keys are rotated (changed) within the number of days specified in maxAccessKeyAge. The rule is NON_COMPLIANT if access keys are not rotated within the specified time period. The default value is 90 days.
8.3.7	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-scheduled-rotation-success-check	Ensure that AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.7	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-secret-periodic-rotation	Ensure that AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.
8.3.9	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	access-keys-rotated	Ensure that active IAM access keys are rotated (changed) within the number of days specified in maxAccessKeyAge. The rule is NON_COMPLIANT if access keys are not rotated within the specified time period. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.3.9	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-scheduled-rotation-success-check	Ensure that AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.
8.3.9	Strong authentication for users and administrators is established and managed. (PCI-DSS-v4.0)	secretsmanager-secret-periodic-rotation	Ensure that AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.4.1	Multi-factor authentication (MFA) is implemented to secure access into the CDE. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.
8.4.2	Multi-factor authentication (MFA) is implemented to secure access into the CDE. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.
8.4.3	Multi-factor authentication (MFA) is implemented to secure access into the CDE. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
8.6.3	Use of application and system accounts and associated authentication factors is strictly managed. (PCI-DSS-v4.0)	access-keys-rotated	Ensure that active IAM access keys are rotated (changed) within the number of days specified in maxAccess KeyAge. The rule is NON_COMPLIANT if access keys are not rotated within the specified time period. The default value is 90 days.
8.6.3	Use of application and system accounts and associated authentication factors is strictly managed. (PCI-DSS-v4.0)	secretsmanager-scheduled-rotation-success-check	Ensure that AWS Secrets Manager secrets rotated successfully according to the rotation schedule. Secrets Manager calculates the date the rotation should happen. The rule is NON_COMPLIANT if the date passes and the secret isn't rotated.

Control ID	Control Description	AWS Config Rule	Guidance
8.6.3	Use of application and system accounts and associated authentication factors is strictly managed. (PCI-DSS-v4.0)	secretsmanager-secret-periodic-rotation	Ensure that AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON_COMPLIANT if a secret has not been rotated for more than maxDaysSinceRotation number of days. The default value is 90 days.
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	neptune-cluster-snapshot-public-prohibited	Ensure that an Amazon Neptune manual DB cluster snapshot is not public. The rule is NON_COMPLIANT if any existing and new Neptune cluster snapshot is public.
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	docdb-cluster-snapshot-public-prohibited	Ensure that Amazon DocumentDB manual cluster snapshots are not public. The rule is NON_COMPLIANT if any Amazon DocumentDB manual cluster snapshots are public.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGroupRuleRanges.
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
A1.1.2	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	api-gw-endpoint-type-check	Ensure that Amazon API Gateway APIs are of the type specified in the rule parameter 'endpointConfigurationType'. The rule returns NON_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	cloudfront-associated-with-waf	Ensure that Amazon CloudFront distributions are associated with either web application firewall (WAF) or WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT if a CloudFront distribution is not associated with a WAF web ACL.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	cloudfront-custom-ssl-certificate	Ensure that the certificate associated with an Amazon CloudFront distribution is not the default SSL certificate. The rule is NON_COMPLIANT if a CloudFront distribution uses the default SSL certificate.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	netfw-policy-default-action-fragment-packets	Ensure that an AWS Network Firewall policy is configured with a user defined stateless default action for fragmented packets. The rule is NON_COMPLIANT if stateless default action for fragmented packets does not match with user defined default action.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	rds-db-security-group-not-allowed	Ensure that the Amazon Relational Database Service (Amazon RDS) DB security groups is the default one. The rule is NON_COMPLIANT if there are any DB security groups that are not the default DB security group.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	ec2-transit-gateway-auto-vpc-attach-disabled	Ensure that Amazon Elastic Compute Cloud (Amazon EC2) Transit Gateways do not have 'AutoAcceptSharedAttachments' enabled. The rule is NON_COMPLIANT for a Transit Gateway if 'AutoAcceptSharedAttachments' is set to 'enable'.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	eks-endpoint-no-public-access	Ensure that the Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON_COMPLIANT if the endpoint is publicly accessible.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	restricted-ssh	Note: For this rule, the rule identifie r (INCOMING _SSH_DISABLED) and rule name (restricted-ssh) are different. Ensure that the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT if the IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0 or ::/0). Otherwise, NON_COMPLIANT.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	appsync-associated-with-waf	Ensure that AWS AppSync APIs are associated with AWS WAFv2 web access control lists (ACLs). The rule is NON_COMPLIANT for an AWS AppSync API if it is not associated with a web ACL.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	docdb-cluster-snapshot-public-prohibited	Ensure that Amazon DocumentDB manual cluster snapshots are not public. The rule is NON_COMPLIANT if any Amazon DocumentDB manual cluster snapshots are public.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	codebuild-project-source-repo-url-check	Ensure that the Bitbucket source repository URL DOES NOT contain sign-in credentials or not. The rule is NON_COMPLIANT if the URL contains any sign-in information and COMPLIANT if it doesn't.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	elb-acm-certificate-required	Ensure that the Classic Load Balancers use SSL certificates provided by AWS Certifica te Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. Note - this rule is only applicable to Classic Load Balancers. This rule does not check Applicati on Load Balancers and Network Load Balancers.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	emr-block-public-a ccess	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurit yGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGrou pRuleRanges.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	nacl-no-unrestricted-ssh-rdp	Ensure that default ports for SSH/RDP ingress traffic for network access control lists (NACLs) are restricted. The rule is NON_COMPLIANT if a NACL inbound entry allows a source TCP or UDP CIDR block for ports 22 or 3389.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	waf-global-webacl-not-empty	Ensure that a WAF Global Web ACL contains some WAF rules or rule groups. This rule is NON_COMPLIANT if a Web ACL does not contain any WAF rule or rule group.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	waf-global-rulegroup-not-empty	Ensure that an AWS WAF Classic rule group contains some rules. The rule is NON_COMPLIANT if there are no rules present within a rule group.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	waf-global-rule-not-empty	Ensure that an AWS WAF global rule contains some conditions. The rule is NON_COMPLIANT if no conditions are present within the WAF global rule.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	ec2-client-vpn-not-authorize-all	Ensure that the AWS Client VPN authorization rules does not authorize connection access for all clients. The rule is NON_COMPLIANT if 'AccessAll' is present and set to true.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	internet-gateway-authorized-vpc-only	Ensure that internet gateways are attached to an authorized virtual private cloud (Amazon VPC). The rule is NON_COMPLIANT if internet gateways are attached to an unauthorized VPC.

Control ID	Control Description	AWS Config Rule	Guidance
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
A1.1.3	Multi-tenant service providers protect and separate all customer environments and data. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	api-gwv2-access-logs-enabled	Ensure that Amazon API Gateway V2 stages have access logging enabled. The rule is NON_COMPLIANT if 'accessLogSettings' is not present in Stage configuration.

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	cloudfront-accesslogs-enabled	Ensure that Amazon CloudFront distributions are configured to deliver access logs to an Amazon S3 bucket. The rule is NON_COMPLIANT if a CloudFront distribution does not have logging configured.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	cloudtrail-security-trail-enabled	Ensure that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	neptune-cluster-cloudwatch-log-export-enabled	Ensure that an Amazon Neptune cluster has CloudWatch log export enabled for audit logs. The rule is NON_COMPLIANT if a Neptune cluster does not have CloudWatch log export enabled for audit logs.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	ecs-task-definition-log-configuration	Ensure that logConfiguration is set on active ECS Task Definitions. This rule is NON_COMPLIANT if an active ECSTaskDefinition does not have the logConfiguration resource defined or the value for logConfiguration is null in at least one container definition.

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	cloudtrail-enabled	Note: For this rule, the rule identifier (CLOUD_TRAIL_ENABLED) and rule name (cloudtrail-enabled) are different. Ensure that an AWS CloudTrail trail is enabled in your AWS account. The rule is NON_COMPLIANT if a trail is not enabled. Optionally, the rule checks a specific S3 bucket, Amazon Simple Notification Service (Amazon SNS) topic, and CloudWatch log group.

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	multi-region-cloudtrail-enabled	Note: for this rule, the rule identifier (MULTI_REGION_CLOUD_TRAIL_ENABLED) and rule name (multi-region-cloudtrail-enabled) are different. Ensure that there is at least one multi-region AWS CloudTrail. The rule is NON_COMPLIANT if the trails do not match input parameters. The rule is NON_COMPLIANT if the ExcludeManagementEventSources field is not empty or if AWS CloudTrail is configured to exclude management events such as AWS KMS events or Amazon RDS Data API events.

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	appsync-logging-enabled	Ensure that an AWS AppSync API has logging enabled. The rule is NON_COMPLIANT if logging is not enabled, or 'fieldLogLevel' is neither ERROR nor ALL.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	waf-classic-logging-enabled	Ensure that logging is enabled on AWS WAF classic global web access control lists (web ACLs). The rule is NON_COMPLIANT for a global web ACL, if it does not have logging enabled.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	mq-cloudwatch-audit-logging-enabled	Ensure that Amazon MQ brokers have Amazon CloudWatch audit logging enabled. The rule is NON_COMPLIANT if a broker does not have audit logging enabled.

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	mq-cloudwatch-audit-log-enabled	Ensure that an Amazon MQ broker has CloudWatch audit logging enabled. The rule is NON_COMPLIANT if the broker does not have audit logging enabled.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	eks-cluster-logging-enabled	Ensure that an Amazon Elastic Kubernetes Service (Amazon EKS) cluster is configured with logging enabled. The rule is NON_COMPLIANT if logging for Amazon EKS clusters is not enabled for all log types.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	elastic-beanstalk-logs-to-cloudwatch	Ensure that AWS Elastic Beanstalk environments are configured to send logs to Amazon CloudWatch Logs. The rule is NON_COMPLIANT if the value of `StreamLogs` is false.

Control ID	Control Description	AWS Config Rule	Guidance
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	step-functions-state-machine-logging-enabled	Ensure that AWS Step Functions machine has logging enabled. The rule is NON_COMPLIANT if a state machine does not have logging enabled or the logging configuration is not at the minimum level provided.
A1.2.1	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	netfw-logging-enabled	Ensure that AWS Network Firewall firewalls have logging enabled. The rule is NON_COMPLIANT if a logging type is not configured. You can specify which logging type you want the rule to check.
A1.2.3	Multi-tenant service providers facilitate logging and incident response for all customers. (PCI-DSS-v4.0)	security-account-information-provided	Ensure that you have provided security contact information for your AWS account contacts. The rule is NON_COMPLIANT if security contact information within the account is not provided.

Control ID	Control Description	AWS Config Rule	Guidance
A3.2.5.1	PCI DSS scope is documented and validated. (PCI-DSS-v4.0)	macie-auto-sensitive-data-discovery-check	Ensure that automated sensitive data discovery is enabled for Amazon Macie. The rule is NON_COMPLIANT if automated sensitive data discovery is disabled. The rule is APPLICABLE for administrator accounts and NOT_APPLICABLE for member accounts.
A3.2.5.1	PCI DSS scope is documented and validated. (PCI-DSS-v4.0)	macie-status-check	Ensure that Amazon Macie is enabled in your account per region. The rule is NON_COMPLIANT if the 'status' attribute is not set to 'ENABLED'.

Control ID	Control Description	AWS Config Rule	Guidance
A3.2.5.2	PCI DSS scope is documented and validated. (PCI-DSS-v4.0)	macie-auto-sensitive-data-discovery-check	Ensure that automated sensitive data discovery is enabled for Amazon Macie. The rule is NON_COMPLIANT if automated sensitive data discovery is disabled. The rule is APPLICABLE for administrator accounts and NOT_APPLICABLE for member accounts.
A3.2.5.2	PCI DSS scope is documented and validated. (PCI-DSS-v4.0)	macie-status-check	Ensure that Amazon Macie is enabled in your account per region. The rule is NON_COMPLIANT if the 'status' attribute is not set to 'ENABLED'.
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.

Control ID	Control Description	AWS Config Rule	Guidance
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudformation-stack-notification-check	Ensure that your CloudFormation stacks send event notifications to an Amazon SNS topic. Optionally ensure that specified Amazon SNS topics are used. The rule is NON_COMPLIANT if CloudFormation stacks do not send notifications.
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	cloudwatch-alarm-settings-check	Ensure that CloudWatch alarms with the given metric name have the specified settings.
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.

Control ID	Control Description	AWS Config Rule	Guidance
A3.3.1	PCI DSS is incorporated into business-as-usual (BAU) activities. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	neptune-cluster-snapshot-public-prohibited	Ensure that an Amazon Neptune manual DB cluster snapshot is not public. The rule is NON_COMPLIANT if any existing and new Neptune cluster snapshot is public.
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	docdb-cluster-snapshot-public-prohibited	Ensure that Amazon DocumentDB manual cluster snapshots are not public. The rule is NON_COMPLIANT if any Amazon DocumentDB manual cluster snapshots are public.

Control ID	Control Description	AWS Config Rule	Guidance
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	backup-recovery-point-manual-deletion-disabled	Ensure that a backup vault has an attached resource-based policy which prevents deletion of recovery points. The rule is NON_COMPLIANT if the Backup Vault does not have resource-based policies or has policies without a suitable 'Deny' statement (statement with backup:DeleteRecoveryPoint, backup:UpdateRecoveryPointLifecycle, and backup:PutBackupVaultAccessPolicy permissions).

Control ID	Control Description	AWS Config Rule	Guidance
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	emr-block-public-access	Ensure that an account with Amazon EMR has block public access settings enabled. The rule is NON_COMPLIANT if BlockPublicSecurityGroupRules is false, or if true, ports other than Port 22 are listed in Permitted PublicSecurityGroupRuleRanges.
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	secretsmanager-secret-unused	Ensure that AWS Secrets Manager secrets have been accessed within a specified number of days. The rule is NON_COMPLIANT if a secret has not been accessed in 'unusedForDays' number of days. The default value is 90 days.

Control ID	Control Description	AWS Config Rule	Guidance
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	s3-access-point-public-access-blocks	Ensure that Amazon S3 access points have block public access settings enabled. The rule is NON_COMPLIANT if block public access settings are not enabled for S3 access points.
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	s3-account-level-public-access-blocks	Ensure that the required public access block settings are configured from account level. The rule is only NON_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.
A3.4.1	Logical access to the cardholder data environment is controlled and managed. (PCI-DSS-v4.0)	s3-bucket-mfa-delete-enabled	Ensure that MFA Delete is enabled in the Amazon Simple Storage Service (Amazon S3) bucket versioning configuration. The rule is NON_COMPLIANT if MFA Delete is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	api-gw-xray-enabled	Ensure that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule is COMPLIANT if X-Ray tracing is enabled and NON_COMPLIANT otherwise.
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudformation-stack-notification-check	Ensure that your CloudFormation stacks send event notifications to an Amazon SNS topic. Optionally ensure that specified Amazon SNS topics are used. The rule is NON_COMPLIANT if CloudFormation stacks do not send notifications.
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	ec2-instance-detailed-monitoring-enabled	Ensure that detailed monitoring is enabled for EC2 instances. The rule is NON_COMPLIANT if detailed monitoring is not enabled.

Control ID	Control Description	AWS Config Rule	Guidance
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-action-check	Ensure that CloudWatch alarms have an action configured for the ALARM, INSUFFICIENT_DATA, or OK state. Optionally ensure that any actions match a named ARN. The rule is NON_COMPLIANT if there is no action specified for the alarm or optional parameter.

Control ID	Control Description	AWS Config Rule	Guidance
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-resource-check	Ensure that a resource type has a CloudWatch alarm for the named metric. For resource type, you can specify EBS volumes, EC2 instances, Amazon RDS clusters, or S3 buckets. The rule is COMPLIANT if the named metric has a resource ID and CloudWatch alarm.
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	cloudwatch-alarm-settings-check	Ensure that CloudWatch alarms with the given metric name have the specified settings.
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	wafv2-rulegroup-logging-enabled	Ensure that Amazon CloudWatch security metrics collection on AWS WAFv2 rule groups is enabled. The rule is NON_COMPLIANT if the 'VisibilityConfig.CloudWatchMetricsEnabled' field is set to false.

Control ID	Control Description	AWS Config Rule	Guidance
A3.5.1	Suspicious events are identified and responded to. (PCI-DSS-v4.0)	sns-topic-message-delivery-notification-enabled	Ensure that Amazon Simple Notification Service (SNS) logging is enabled for the delivery status of notification messages sent to a topic for the endpoints. The rule is NON_COMPLIANT if the delivery status notification for messages is not enabled.

Template

The template is available on GitHub: Operational Best Practices for PCI DSS 4.0 (Including global resource types).

Operational Best Practices for Publicly Accessible Resources

This conformance pack helps identify resources that may be publicly accessible.

For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Operational Best Practices for Publicly Accessible Resources.

Operational Best Practices for RBI Cyber Security Framework for UCBs

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard.

You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Reserve Bank of India (RBI) Cyber Security Framework for Urban Cooperative Banks (UCBs) and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more RBI Cyber Security Framework for UCBs controls. An RBI Cyber Security Framework for UCBs control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

Control ID	AWS Config Rule	Guidance
Annex_I(1.1)	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
Annex_I(1.1)	account-part-of-organizations	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which

Control ID	AWS Config Rule	Guidance
		may expose resources and sensitive data.
Annex_I(1.1)	ecr-private-tag-immutability-enabled	Enable Elastic Container Repository (ECR) Tag Immutability to prevent image tags on your ECR images from being overwritt en. Previously, tags could be overwritten requiring manual methodologies to uniquely identify an image.
Annex_I(1.3)	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired . This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
Annex_I(1.3)	alb-http-drop-invalid-header-enabled	Ensure that your Elastic Load Balancers (ELB) are configure d to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
Annex_I(1.3)	api-gw-cache-enabled-and-encrypted	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
Annex_I(1.3)	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
Annex_I(1.3)	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	elbv2-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Annex_I(1.3)	s3-default-encryption-kms	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.
Annex_I(1.3)	cloudwatch-log-group-encrypted	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
Annex_I(1.3)	cmk-backing-key-rotation-enabled	Enable key rotation to ensure that keys are rotated after they have reached the end of their crypto period.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	backup-recovery-point-encrypted	Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
Annex_I(1.3)	codebuild-project-artifact-encryption	To help protect sensitive data at rest, ensure encryption is enabled for your AWS CodeBuild artifacts.
Annex_I(1.3)	codebuild-project-s3-logs-encrypted	To help protect sensitive data at rest, ensure encryption is enabled for your AWS CodeBuild logs stored in Amazon S3.
Annex_I(1.3)	opensearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains.
Annex_I(1.3)	opensearch-https-required	Because sensitive data can exist and to help protect data in transit, ensure HTTPS is enabled for connections to your Amazon OpenSearch Service domains.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	opensearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
Annex_I(1.3)	dynamodb-table-encrypted-kms	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
Annex_I(1.3)	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
Annex_I(1.3)	elasticsearch-encrypted-at-rest	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains.
Annex_I(1.3)	elasticsearch-node-to-node-encryption-check	Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communica tions within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	elb-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryptio n is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Annex_I(1.3)	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configure d with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data.
Annex_I(1.3)	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	kms-cmk-not-scheduled-for-deletion	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
Annex_I(1.3)	rds-snapshot-encrypted	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
Annex_I(1.3)	rds-storage-encrypted	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.
Annex_I(1.3)	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
Annex_I(1.3)	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
Annex_I(1.3)	sagemaker-endpoint-configuration-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	sagemaker-notebook-instance-kms-key-configured	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryptio n at rest to help protect that data.
Annex_I(1.3)	sns-encrypted-kms	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryptio n at rest to help protect that data.
Annex_I(1.3)	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
Annex_I(1.3)	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
Annex_I(1.3)	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
Annex_I(1.3)	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	autoscaling-launch-config-public-ip-disabled	If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers.
Annex_I(1.3)	no-unrestricted-route-to-igw	Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment.
Annex_I(1.3)	redshift-cluster-kms-enabled	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
Annex_I(1.3)	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.
Annex_I(1.3)	internet-gateway-authorized-vpc-only	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorize d Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthori zed access to Amazon VPC resources.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
Annex_I(1.3)	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
Annex_I(1.3)	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
Annex_I(1.3)	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organization's policies.
Annex_I(1.3)	s3-bucket-level-public-acce ss-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
Annex_I(1.3)	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Annex_I(1.3)	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
Annex_I(5.1)	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	AWS Config Rule	Guidance
Annex_I(5.1)	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
Annex_I(5.1)	waf-regional-rule-not-empty	Ensure your AWS WAF has a rule that is not empty. A rule with no conditions could result in unintended behavior.
Annex_I(5.1)	waf-regional-rulegroup-not-empty	Ensure your AWS WAF has a rule group that is not empty. A rule group that is empty could result in unintended behavior.
Annex_I(5.1)	waf-regional-webacl-not-empty	A Web ACL attached to an AWS WAF can contain a collection of rules and rule groups to inspect and control web requests. If a Web ACL is empty, the web traffic passes without being detected or acted upon by the WAF.

Control ID	AWS Config Rule	Guidance
Annex_I(5.1)	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
Annex_I(5.1)	api-gw-associated-with-waf	AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks

Control ID	AWS Config Rule	Guidance
Annex_I(5.1)	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Annex_I(5.1)	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Annex_I(6)	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
Annex_I(6)	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	AWS Config Rule	Guidance
Annex_I(6)	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.
Annex_I(6)	elastic-beanstalk-managed-updates-enabled	Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems.

Control ID	AWS Config Rule	Guidance
Annex_I(6)	rds-automatic-minor-version-upgrade-enabled	Enable automatic minor version upgrades on your Amazon Relationa l Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes.
Annex_I(6)	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Annex_I(6)	vuln-management-plan-exists (process check)	Ensure a vulnerability management plan is developed and implemented in order to have a formally defined processes to address vulnerabilities in your environment.
Annex_I(7.1)	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Annex_I(7.1)	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
Annex_I(7.1)	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-base d AWS accounts to help to incorporate the principle of least functionality.
Annex_I(7.1)	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
Annex_I(7.1)	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	AWS Config Rule	Guidance
Annex_I(7.2)	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUp percaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The

Control ID	AWS Config Rule	Guidance
		actual values should reflect your organization's policies.
Annex_I(7.3)	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Annex_I(7.4)	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
Annex_I(7.4)	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	AWS Config Rule	Guidance
Annex_I(7.4)	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Annex_I(7.4)	cloudtrail-s3-dataevents-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
Annex_I(7.4)	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	AWS Config Rule	Guidance
Annex_I(7.4)	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Annex_I(7.4)	cw-loggroup-retention-period-check	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.

Control ID	AWS Config Rule	Guidance
Annex_I(7.4)	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
Annex_I(7.4)	codebuild-project-logging-enabled	Ensure AWS CodeBuild project logging is enabled so that your build output logs are sent to either Amazon CloudWatch or Amazon Simple Storage Service (Amazon S3). Build output logs provide detailed information about your build project.

Control ID	AWS Config Rule	Guidance
Annex_I(7.4)	opensearch-audit-logging-enabled	Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries.
Annex_I(7.4)	opensearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues.
Annex_I(7.4)	redshift-audit-logging-enabled	To capture information about connections and user activities on your Amazon Redshift cluster, ensure audit logging is enabled.

Control ID	AWS Config Rule	Guidance
Annex_I(7.4)	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
Annex_I(7.4)	rds-logging-enabled	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	AWS Config Rule	Guidance
Annex_I(7.4)	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
Annex_I(7.4)	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	AWS Config Rule	Guidance
Annex_I(7.4)	wafv2-logging-enabled	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, informati on about the request, and an action for the rule that each request matched.
Annex_I(7.4)	redshift-cluster-configurat ion-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activitie s in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Annex_I(10.2)	security-awareness-program-exists (process check)	Establish and maintain a security awareness program for your organization. Security awareness programs educate employees on how to protect their organizat ion from various security breaches or incidents.
Annex_I(12)	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
Annex_I(12)	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
Annex_I(12)	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
Annex_I(12)	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
Annex_I(12)	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
Annex_I(12)	aurora-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
Annex_I(12)	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	AWS Config Rule	Guidance
Annex_I(12)	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
Annex_I(12)	redshift-backup-enabled	To help with data backup processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	AWS Config Rule	Guidance
Annex_I(12)	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
Annex_I(12)	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	AWS Config Rule	Guidance
Annex_I(12)	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Template

The template is available on GitHub: Operational Best Practices for RBI Cyber Security Framework for UCBs.

Operational Best Practices for RBI MD-ITF

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Reserve Bank of India (RBI) Master Direction – Information Technology Framework and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more RBI Master Direction – Information Technology Framework controls. An RBI Master Direction – Information Technology Framework control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(a)	Identification and Classification of Information Assets.	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
3.1(a)	Identification and Classification of Information Assets.	ec2-stopped-instance	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for

Control ID	Control Description	AWS Config Rule	Guidance
			more than the allowed number of days, according to your organization's standards.
3.1(a)	Identification and Classification of Information Assets.	ec2-volume-inuse-check	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(a)	Identification and Classification of Information Assets.	ecr-private-tag-immutability-enabled	Enable Elastic Container Repository (ECR) Tag Immutability to prevent image tags on your ECR images from being overwritten. Previously, tags could be overwritten requiring manual methodologies to uniquely identify an image.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	access-keys-rotated	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	emr-kerberos-enabled	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
3.1(c)	Role Based Access Control	ecs-task-definition-nonroot-user	To assist with implementing the principle of least privilege, ensure that a non-root user is designated for access to your Amazon Elastic Container Service (Amazon ECS) task definitions.
3.1(c)	Role Based Access Control	efs-access-point-enforce-root-directory	Enforcing a root directory for an Amazon Elastic File System (Amazon EFS) access point helps restrict data access by ensuring that users of the access point can only reach files of the specified subdirectory.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	efs-access-point-enforce-user-identity	To assist with implementing the principle of least privilege, ensure user enforcement is enabled for your Amazon Elastic File System (Amazon EFS) .When enabled, Amazon EFS replaces the NFS client's user and group IDs with the identity configured on the access point for all file system operations and only grants access to this enforced user identity.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	iam-group-has-users-check	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissio ns or job function is one way to incorpora te least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa

Control ID	Control Description	AWS Config Rule	Guidance
			sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
3.1(c)	Role Based Access Control	iam-user-group-membership-check	AWS Identity and Access Managemen t (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of sign-in credentials. Reduce the incidents of compromised accounts by requiring MFA for users.
3.1(c)	Role Based Access Control	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.
3.1(c)	Role Based Access Control	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	root-account-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
3.1(c)	Role Based Access Control	secretsmanager-rotation-enabled-check	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	secretsmanager-scheduled-rotation-success-check	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(g)	Incident Management	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(g)	Incident Management	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.
3.1(g)	Incident Management	alb-waf-enabled	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(g)	Incident Management	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(g)	Incident Management	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
3.1(h)	Trails	api-gw-execution-logging-enabled	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
3.1(h)	Trails	codebuild-project-logging-enabled	Ensure AWS CodeBuild project logging is enabled so that your build output logs are sent to either Amazon CloudWatch or Amazon Simple Storage Service (Amazon S3). Build output logs provide detailed informati on about your build project.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	opensearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues.
3.1(h)	Trails	redshift-audit-logging-enabled	To capture information about connections and user activities on your Amazon Redshift cluster, ensure audit logging is enabled.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	cloudtrail-enabled	AWS CloudTrail can help in non-repud iation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated , and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
3.1(h)	Trails	cloudtrail-s3-data events-enabled	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	cw-loggroup-retention-period-check	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
3.1(h)	Trails	elasticsearch-logs-to-cloudwatch	Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	elb-logging-enabled	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	multi-region-cloudtrail-enabled	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	rds-logging-enabled	To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	wafv2-logging-enabled	To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	redshift-cluster-configuration-check	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(i)	Public Key Infrastructure	acm-certificate-expiration-check	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
3.1(i)	Public Key Infrastructure	alb-http-drop-invalid-header-enabled	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(i)	Public Key Infrastructure	alb-http-to-https-redirection-check	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1(i)	Public Key Infrastructure	api-gw-ssl-enabled	Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway.
3.1(i)	Public Key Infrastructure	opensearch-https-required	Because sensitive data can exist and to help protect data in transit, ensure HTTPS is enabled for connections to your Amazon OpenSearch Service domains.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(i)	Public Key Infrastructure	elbv2-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
3.1(i)	Public Key Infrastructure	elb-acm-certificate-required	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(i)	Public Key Infrastructure	elb-tls-https-listeners-only	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1(i)	Public Key Infrastructure	redshift-require-tls-ssl	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(i)	Public Key Infrastructure	s3-bucket-ssl-requests-only	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
3.3	Vulnerability Management	elastic-beanstalk-managed-updates-enabled	Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems.

Control ID	Control Description	AWS Config Rule	Guidance
3.3	Vulnerability Management	rds-automatic-minor-version-upgrade-enabled	Enable automatic minor version upgrades on your Amazon Relational Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes.

Control ID	Control Description	AWS Config Rule	Guidance
3.3	Vulnerability Management	redshift-cluster-maintenancesettings-check	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.3	Vulnerability Management	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.3	Vulnerability Management	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.3	Vulnerability Management	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.3	Vulnerability Management	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
3.5	Cyber Crisis Management Plan	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.5	Cyber Crisis Management Plan	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.5	Cyber Crisis Management Plan	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.5	Cyber Crisis Management Plan	ec2-managedinstance-association-compliance-status-check	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.5	Cyber Crisis Management Plan	ec2-managedinstance-patch-compliance-status-check	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
3.9	IT Risk Assessment	annual-risk-assessment-performed (process check)	Perform an annual risk assessment on your organization. Risk assessments can assist in determining the likelihood and impact of identified risks and/or vulnerabilities affecting an organization.

Control ID	Control Description	AWS Config Rule	Guidance
3.12	Training	security-awareness-program-exists (process check)	Establish and maintain a security awareness program for your organization. Security awareness programs educate employees on how to protect their organization from various security breaches or incidents.
4.4(g)	Fraud analysis-Suspicious transaction analysis, embezzlement, theft or suspected money-laundering, misappropriation of assets, manipulation of financial records etc. The regulatory requirement of reporting fraud to RBI should be system driven.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
4.4(h)	Capacity and performance analysis of IT security systems.	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	clb-multiple-az	Elastic Load Balancing (ELB) automatically distributes your incoming traffic across multiple targets, such as EC2 instances, containers, and IP addresses, in an availability zone. To ensure high availability, ensure your ELB has registered instances from multiple Availability Zones.
4.4(h)	Capacity and performance analysis of IT security systems.	elbv2-multiple-az	Elastic Load Balancing (ELB) automatically distributes your incoming traffic across multiple targets, such as EC2 instances, containers, and IP addresses, in an availability zone. To ensure high availability, ensure your ELB has registered instances from multiple Availability Zones.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	lambda-vpc-multi-az-check	If your AWS Lambda function is configure d to connect to a virtual private cloud (VPC) in your account, deploy the AWS Lambda function in at least two different Availability Zones to ensure that it is your function is available to process events in case of a service interruption in a single zone.
4.4(h)	Capacity and performance analysis of IT security systems.	rds-instance-delet ion-protection-ena bled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protectio n enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	rds-multi-az-support	Multi-AZ support in Amazon Relationa l Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availabil ity Zone. Each Availability Zone runs on its own physicall y distinct, independe nt infrastructure, and is engineered to be highly reliable. In case of an infrastru cture failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operation s as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	s3-bucket-default-lock-enabled	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	autoscaling-group-elb-healthcheck-required	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	dynamodb-throughput-limit-check	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	ec2-instance-detailed-monitoring-enabled	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
4.4(h)	Capacity and performance analysis of IT security systems.	lambda-concurrency-check	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
4.4(h)	Capacity and performance analysis of IT security systems.	lambda-dlq-check	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	beanstalk-enhanced-health-reporting-enabled	AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	rds-enhanced-monitoring-enabled	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	ebs-optimized-instance	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
4.4(h)	Capacity and performance analysis of IT security systems.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(i)	Incident reporting , their impact and steps taken for non -recurrence of such events in the future.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(i)	Incident reporting, their impact and steps taken for non-recurrence of such events in the future.	guardduty-non-archived-findings	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	aurora-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	backup-recovery-point-minimum-retention-check	To help with data back-up processes, ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredRetentionDays (config default: 35) parameter. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	cmk-backing-key-rotation-enabled	Enable key rotation to ensure that keys are rotated after they have reached the end of their crypto period.
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	ec2-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	fsx-resources-protected-by-backup-plan	To help with data back-up processes, ensure your Amazon FSx file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	dynamodb-autoscaling-enabled	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	elb-cross-zone-load-balancing-enabled	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	elb-deletion-protection-enabled	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	clb-multiple-az	Elastic Load Balancing (ELB) automatically distributes your incoming traffic across multiple targets, such as EC2 instances, containers, and IP addresses, in an availability zone. To ensure high availability, ensure your ELB has registered instances from multiple Availability Zones.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	elbv2-multiple-az	Elastic Load Balancing (ELB) automatically distributes your incoming traffic across multiple targets, such as EC2 instances, containers, and IP addresses, in an availability zone. To ensure high availability, ensure your ELB has registered instances from multiple Availability Zones.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	lambda-vpc-multi-az-check	If your AWS Lambda function is configure d to connect to a virtual private cloud (VPC) in your account, deploy the AWS Lambda function in at least two different Availability Zones to ensure that it is your function is available to process events in case of a service interruption in a single zone.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	rds-instance-deletion-protection-enabled	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protectio n enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	rds-multi-az-support	Multi-AZ support in Amazon Relationa l Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availabil ity Zone. Each Availability Zone runs on its own physicall y distinct, independe nt infrastructure, and is engineered to be highly reliable. In case of an infrastru cture failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operation s as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	vpc-vpn-2-tunnels-up	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	autoscaling-group-elb-healthcheck-required	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	dynamodb-throughput-limit-check	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	ec2-instance-detailed-monitoring-enabled	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	guardduty-enabled-centralized	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	lambda-concurrency-check	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	rds-enhanced-monitoring-enabled	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	s3-bucket-policy-grantee-check	Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	dms-replication-not-public	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	ebs-snapshot-public-restorable-check	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	elasticsearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	emr-master-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	internet-gateway-authorized-vpc-only	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communica tion between a function and other services within the Amazon VPC. With this configuration, there is no requireme nt for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	rds-instance-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	rds-snapshots-public-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	redshift-cluster-public-access-check	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	sagemaker-notebook-no-direct-internet-access	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthorized users.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	access-keys-rotated	The credentials are audited for authorize d devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromis ed. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	emr-kerberos-enabled	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative

Control ID	Control Description	AWS Config Rule	Guidance
			information about each principal.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	iam-group-has-users-check	AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissio ns or job function is one way to incorpora te least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa

Control ID	Control Description	AWS Config Rule	Guidance
			sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	autoscaling-launch -config-public-ip- disabled	If you configure your Network Interfaces with a public IP address, then the associate d resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessibl e, as this may allow unintended access to your applications or servers.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	iam-policy-no-statements-with-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	ecs-task-definition-nonroot-user	To assist with implementing the principle of least privilege, ensure that a non-root user is designated for access to your Amazon Elastic Container Service (Amazon ECS) task definitions.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	efs-access-point-enforce-root-directory	Enforcing a root directory for an Amazon Elastic File System (Amazon EFS) access point helps restrict data access by ensuring that users of the access point can only reach files of the specified subdirectory.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	efs-access-point-enforce-user-identity	To assist with implementing the principle of least privilege, ensure user enforcement is enabled for your Amazon Elastic File System (Amazon EFS) .When enabled, Amazon EFS replaces the NFS client's user and group IDs with the identity configured on the access point for all file system operations and only grants access to this enforced user identity.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	s3-bucket-acl-prohibited	This rule checks to see if Access Control Lists (ACLs) are used to for access control on Amazon S3 Buckets. ACLs are legacy access control mechanisms for Amazon S3 buckets that predate AWS Identity and Access Management (IAM). Instead of ACLs, it is a best practice to use IAM policies or S3 bucket policies to more easily manage access to your S3 buckets.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	s3-bucket-level-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	subnet-auto-assign-public-ip-disabled	Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	iam-user-group-membership-check	AWS Identity and Access Managemen t (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privilege s than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of sign-in credentials. Reduce the incidents of compromised accounts by requiring MFA for users.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	opensearch-in-vpc-only	Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	root-account-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	secretsmanager-rotation-enabled-check	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	secretsmanager-scheduled-rotation-success-check	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
8.II	A well-defined user role.	iam-group-has-users-check	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
8.II	A well-defined user role.	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management.

Control ID	Control Description	AWS Config Rule	Guidance
8.II	A well-defined user role.	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa

Control ID	Control Description	AWS Config Rule	Guidance
			sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.II	A well-defined user role.	iam-policy-no-statements-with-admin-access	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
8.II	A well-defined user role.	iam-user-group-membership-check	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
8.II	A well-defined user role.	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
8.II	A well-defined user role.	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.III	A Maker-checker concept to reduce the risk of error and misuse and to ensure reliability of data/ information.	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and applicati on failures.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	db-instance-backup-enabled	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requireme nts.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	dynamodb-in-backup-plan	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
8.IX	Arrangement for backup of data with periodic testing.	dynamodb-pitr-enabled	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	elasticache-redis-cluster-automatic-backup-check	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	rds-in-backup-plan	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	s3-bucket-replication-enabled	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	redshift-backup-enabled	To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	backup-plan-min-frequency-and-min-retention-check	To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	backup-recovery-point-manual-deletion-disabled	Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventin g accidental or intentional deletion.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	backup-recovery-point-minimum-retention-check	To help with data back-up processes, ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredRetentionDays (config default: 35) parameter. The actual value should reflect your organizations requirements.

Template

The template is available on GitHub: Operational Best Practices for RBI MD-ITF.

Operational Best Practices for Security, Identity, and Compliance Services

This conformance pack contains AWS Config rules based on Security, Identity, and Compliance Services. For more information, see Security, Identity, and Compliance on AWS. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Operational Best Practices for Security, Identity, and Compliance Services.

Operational Best Practices for Serverless

This conformance pack contains AWS Config rules based on Serverless solutions. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Operational Best Practices for Serverless.

Operational Best Practices for Storage Services

This conformance pack contains AWS Config rules based on Storage Services. For more information, see Cloud Storage on AWS. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Operational Best Practices for Storage Services.

Operational Best Practices for SWIFT CSP

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates,

are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the SWIFT's Customer Security Programme (CSP) and AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more SWIFT CSP controls. A SWIFT CSP control can be related to multiple AWS Config rules. Refer to the table below for more detail and guidance related to these mappings.

Control ID	AWS Config Rule	Guidance
1.1	ec2-instance-managed-by-systems-manager	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
1.1	ec2-instance-no-public-ip	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
1.1	ec2-no-amazon-key-pair	This rule checks if running Amazon Elastic Compute Cloud (Amazon EC2) instances are launched using amazon key pairs. This can assist in reducing the risk of compromised credentia ls. Amazon EC2 Instances without key pairs can still be accessed using Session Manager or Browser based SSH connection from the AWS console.

Control ID	AWS Config Rule	Guidance
1.1	ec2-instances-in-vpc	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	AWS Config Rule	Guidance
1.1	vpc-default-security-group-closed	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
1.1	vpc-network-acl-unused-check	This rule ensures that Amazon Virtual Private Cloud (VPC) network access control lists are in use. Monitoring for unused network access control lists can assist in accurate inventory and management of your environment.

Control ID	AWS Config Rule	Guidance
1.1	vpc-sg-open-only-to-authorized-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	AWS Config Rule	Guidance
1.2	iam-customer-policy-blocked-kms-actions	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricti ng policies from containin g blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEncryptFrom). The actual values should reflect your organization's policies

Control ID	AWS Config Rule	Guidance
1.2	iam-group-has-users-check	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	AWS Config Rule	Guidance
1.2	iam-inline-policy-blocked-kms-actions	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
1.2	iam-no-inline-policy-check	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
1.2	iam-user-no-policies-check	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
1.2	restricted-ssh	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
1.2	nacl-no-unrestricted-ssh-rdp	Access to remote server administration ports in your Network Access Control Lists (NACLs), such as port 22 (SSH) and port 3389 (RDP), should not be publicly accessible, as this may allow unintende d access to resources within your VPC.

Control ID	AWS Config Rule	Guidance
1.2	s3-bucket-acl-prohibited	This rule checks to see if Access Control Lists (ACLs) are used to for access control on Amazon S3 Buckets. ACLs are legacy access control mechanisms for Amazon S3 buckets that predate AWS Identity and Access Management (IAM). Instead of ACLs, it is a best practice to use IAM policies or S3 bucket policies to more easily manage access to your S3 buckets.
1.2	s3-bucket-logging-enabled	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	AWS Config Rule	Guidance
1.2	s3-bucket-policy-grantee-check	Manage access to the AWS Cloud by enabling s3_ bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	AWS Config Rule	Guidance
1.2	sns-topic-message-delivery-notification-enabled	To assist with logging requirements in your environment, ensure to enable delivery status notifications are enabled for your Amazon Simple Notification Service (Amazon SNS) topics. Logging message delivery status helps provide better operational insight, such as the following: Knowing whether a message was delivered to the Amazon SNS endpoint, identifying the response sent from the Amazon SNS endpoint to Amazon SNS, and determining the message dwell time (the time between the publish timestamp and just before handing off to an Amazon SNS endpoint).

Control ID	AWS Config Rule	Guidance
1.4	internet-gateway-authorized-vpc-only	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorize d Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthori zed access to Amazon VPC resources.
1.4	restricted-common-ports	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
1.4	lambda-function-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
1.4	s3-account-level-public-access-blocks-periodic	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
1.4	s3-bucket-level-public-access-prohibited	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level.
1.4	s3-bucket-public-read-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
1.4	s3-bucket-public-write-prohibited	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
1.4	ssm-document-not-public	Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes.
2.3	ec2-imdsv2-check	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-b ased controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
2.3	ec2-instance-multiple-eni-c heck	This rule checks if your Amazon Elastic Compute Cloud (Amazon EC2) instances have multiple ENIs. Having multiple ENIs can cause dual-homed instances, meaning instances that have multiple subnets. This can add network security complexity and introduce unintended network paths and access.

Control ID	AWS Config Rule	Guidance
2.3	ec2-token-hop-limit-check	Ensure the Instance Metadata Service (IMDS) HTTP PUT response is restricted to the Amazon Elastic Compute Cloud (Amazon EC2) instance. With IMDSv2, the PUT response that contains the secret token by default cannot travel outside the instance, because the Metadata response hop limit is set to 1 (Config default). If this value is greater than 1, the token is able to leave the EC2 instance.
2.3	ec2-volume-inuse-check	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functiona lity.

Control ID	AWS Config Rule	Guidance
2.3	account-part-of-organizations	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant . The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
2.3	lambda-inside-vpc	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communica tion between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	AWS Config Rule	Guidance
2.3	kms-cmk-not-scheduled-for-deletion	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
2.3	s3-bucket-versioning-enabled	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	AWS Config Rule	Guidance
2.3	secretsmanager-secret-unused	If unused credentials exist in AWS Secrets Manager, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule allows you to set a value to the unusedForDays (Config Default: 90). The actual value should reflect your organization's policies.
2.5A	ebs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
2.5A	ec2-ebs-encryption-by-default	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
2.5A	efs-encrypted-check	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
2.5A	efs-in-backup-plan	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
2.5A	encrypted-volumes	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
2.5A	kinesis-stream-encrypted	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Kinesis Streams.
2.5A	s3-bucket-server-side-encryption-enabled	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
2.5A	s3-default-encryption-kms	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
2.5A	sns-encrypted-kms	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryptio n at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
4.1	iam-password-policy	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUp percaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The

Control ID	AWS Config Rule	Guidance
		actual values should reflect your organization's policies.
4.1	access-keys-rotated	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organizat ion's policies.
4.2	iam-user-mfa-enabled	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of sign-in credentials. Reduce the incidents of compromised accounts by requiring MFA for users.

Control ID	AWS Config Rule	Guidance
4.2	mfa-enabled-for-iam-console-access	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
4.2	root-account-hardware-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
4.2	root-account-mfa-enabled	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
5.1	ec2-instance-profile-attached	EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management.
5.1	iam-policy-no-statements-wi th-full-access	Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
5.1	iam-root-access-key-check	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-base d AWS accounts to help to incorporate the principle of least functionality.
5.1	iam-user-group-membership-check	AWS Identity and Access Management (IAM) can help you restrict access permissions and authoriza tions, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
5.1	iam-user-unused-credentials-check	AWS Identity and Access Management (IAM) can help you with access permissio ns and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsage Age (Config Default: 90). The actual value should reflect your organization's policies.
5.4	secretsmanager-rotation-enabled-check	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.

Control ID	AWS Config Rule	Guidance
5.4	secretsmanager-scheduled-rotation-success-check	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
5.4	secretsmanager-secret-periodic-rotation	This rule ensures AWS Secrets Manager secrets have periodic rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised. The default value is 90 days.
5.4	secretsmanager-using-cmk	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
6.4	ec2-instance-detailed-monitoring-enabled	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
6.4	cloudwatch-log-group-encrypted	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
6.4	cloud-trail-cloud-watch-logs-enabled	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
6.4	cloudtrail-enabled	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	AWS Config Rule	Guidance
6.4	cloud-trail-encryption-enabled	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
6.4	cloud-trail-log-file-validation-enabled	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
6.4	ec2-stopped-instance	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.

Control ID	AWS Config Rule	Guidance
6.4	vpc-flow-logs-enabled	The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
6.5A	guardduty-enabled-centraliz ed	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intellige nce feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
6.5A	securityhub-enabled	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Template

The template is available on GitHub: Operational Best Practices for SWIFT CSP.

Security Best Practices for Amazon Elastic Container Service (Amazon ECS)

This conformance pack contains AWS Config rules based on Amazon ECS. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for Amazon ECS.

Security Best Practices for Amazon Elastic File System (Amazon EFS)

This conformance pack contains AWS Config rules based on Amazon EFS. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for Amazon EFS.

Security Best Practices for Amazon Elastic Kubernetes Service (Amazon EKS)

This conformance pack contains AWS Config rules based on Amazon EKS. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for Amazon EKS.

Security Best Practices for Amazon CloudFront

This conformance pack contains AWS Config rules based on Amazon CloudFront. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for Amazon CloudFront.

Security Best Practices for Amazon OpenSearch Service

This conformance pack contains AWS Config rules based on Amazon OpenSearch Service. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for Amazon OpenSearch Service.

Security Best Practices for Amazon Redshift

This conformance pack contains AWS Config rules based on Amazon Redshift. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for Amazon Redshift.

Security Best Practices for Amazon Relational Database Service (Amazon RDS)

This conformance pack contains AWS Config rules based on Amazon RDS. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for Amazon RDS.

Security Best Practices for AWS Auto Scaling

This conformance pack contains AWS Config rules based on AWS Auto Scaling. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for AWS Auto Scaling.

Security Best Practices for AWS CloudTrail

This conformance pack contains AWS Config rules based on AWS CloudTrail. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for AWS CloudTrail.

Security Best Practices for AWS CodeBuild

This conformance pack contains AWS Config rules based on AWS CodeBuild. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for AWS CodeBuild.

Security Best Practices for Amazon ECR

This conformance pack contains AWS Config rules based on Amazon Elastic Container Registry (Amazon ECR). For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for Amazon ECR.

Security Best Practices for AWS Lambda

This conformance pack contains AWS Config rules based on AWS Lambda. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for AWS Lambda.

Security Best Practices for AWS Network Firewall

This conformance pack contains AWS Config rules based on AWS Network Firewall. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for AWS Network Firewall.

Security Best Practices for Amazon SageMaker AI

This conformance pack contains AWS Config rules based on Amazon SageMaker AI. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for Amazon SageMaker AI.

Security Best Practices for AWS Secrets Manager

This conformance pack contains AWS Config rules based on AWS Secrets Manager. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for AWS Secrets Manager.

Security Best Practices for AWS WAF

This conformance pack contains AWS Config rules based on AWS WAF. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security Best Practices for AWS WAF.

Security and Governance Best Practices for AI/ML Supporting Infrastructure

This conformance pack is intended to provide a baseline of security configurations for any AI workload (inclusive of AI, ML, generative AI, agentic AI, and physical AI). For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security and Governance Best Practices for AI/ML Supporting Infrastructure.

Security and Governance Best Practices for Amazon Bedrock

This conformance pack is intended to provide a baseline of security configurations for Amazon Bedrock AI workloads (inclusive of AI, ML, generative AI, agentic AI, and physical AI). Expected to be deployed in conjunction with the Security and Governance Best Practices for AI/ML Supporting

Infrastructure conformance pack. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security and Governance Best Practices for Amazon Bedrock.

Security and Governance Best Practices for Amazon SageMaker AI

This conformance pack is intended to provide a baseline of security configurations for AI workloads (inclusive of AI, ML, generative AI, agentic AI, and physical AI). Expected to be deployed in conjunction with the Security and Governance Best Practices for AI/ML Supporting Infrastructure conformance pack. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security and Governance Best Practices for Amazon SageMaker AI.

Security and Governance Best Practices for Self-Hosted AI/ML

This conformance pack is intended to provide a baseline of security configurations for self-hosted AI/ML workloads (inclusive of AI, ML, generative AI, agentic AI, and physical AI) running on AWS compute, storage, and networking infrastructure. Expected to be deployed in conjunction with the Security and Governance Best Practices for AI/ML Supporting Infrastructure conformance pack. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Security and Governance Best Practices for Self-Hosted AI/ML.

Example Templates with Remediation Action

Operational Best Practices For Amazon DynamoDB with Remediation

The template is available on GitHub: Operational Best Practices For Amazon DynamoDB with Remediation.

Operational Best Practices For Amazon S3 with Remediation

The template is available on GitHub: Operational Best Practices For Amazon S3 with Remediation.

For more information about template structure, see Template Anatomy in the AWS CloudFormation User Guide.

Creating templates for Custom Conformance Packs for AWS Config

A custom conformance pack is a unique collection of AWS Config rules and remediation actions that you can deploy together in an account and an AWS Region, or across an organization in AWS Organizations.

To make a custom conformance pack, follow the steps in the following **Customizing the template** section to author a YAML file that contains the list of AWS Config Managed Rules or AWS Config Custom Rules that you want to work with.

Topics

- Terminology
- Customizing the template

Terminology

AWS Config Managed Rules are predefined rules owned by AWS Config.

AWS Config Custom Rules are rules that you create from scratch.

There are two ways to create AWS Config custom rules: with Lambda functions (AWS Lambda Developer Guide) and with Guard (Guard GitHub Repository), a policy-as-code language. AWS Config custom rules created with AWS Lambda are called *AWS Config Custom Lambda Rules* and AWS Config custom rules created with Guard are called *AWS Config Custom Policy Rules*.

Customizing the template

Creating your YAML file

To create a YAML file, open a text editor and save the file as *.yaml*.

> **Note**
>
> Your file will contain a **Parameters** and **Resources** section.

Parameters

The `Parameters` section in your YAML file is for the rule parameters for the set of AWS Config rules that you will add later in the `Resources` section. Create the `Parameters` section by copying and pasting the following code block into your YAML file, customizing it as needed and repeating for each rule parameter.

```
Parameters:
    NameOfRuleParamNameOfRuleParameter:
        Default: Parameter value
        Type: Type
    ...
```

For example:

```
Parameters:
    IamPasswordPolicyParamMinimumPasswordLength:
        Default: '14'
        Type: String
```

> **Note**
>
> When selecting the AWS Config Rules to build your custom conformance pack, check you have the resources provisioned within your account that will be evaluated for the AWS Config Rules.

1. The first line in the parameter section after `Parameters:` is a concatenated string of *`NameOfRule`* + Param + *`NameOfRuleParameter`*.

   a. Replace *`NameOfRule`* with a consistent name that you create for the rule. For example, that could be **IamPasswordPolicy** for the **iam-password-policy** rule.

   b. Type `Param`.

c. Then, replace *NameOfRuleParameter* with the name of the rule parameter for your specific rule. For AWS Config Managed Rules, the name of the rule parameter is located in the List of AWS Config Managed Rules (for example, **MinimumPasswordLength** is a name of a rule parameter for the **iam-password-policy** rule). For AWS Config Custom Rules, the name of the rule parameter is the name that you chose when you created the rule.

2. If you are using an AWS Config Managed Rule, find the appropriate AWS Config rule in the list of managed rules so you'll know the accepted values for `Default` and `Type` for your particular rule. For AWS Config Custom Rules, use the values you selected when creating your rule.

> **Note**
>
> For each parameter, `Type` must be specified. `Type` can be one of "String", "int", "double", "CSV", "boolean" and "StringMap".

Resources

The `Resources` section lists the rules that are being added to your Custom Conformance Pack. Add the following `Resources` block directly beneath your `Parameters` section, customizing it as needed and repeating for each rule. For more information on the specifications, see AWS::Config::ConfigRule.

```
Resources:
     NameOfRule:
        Properties:
            ConfigRuleName: ActualConfigRuleName
            InputParameters:
                NameOfRuleParameter: !Ref NameOfRuleParamNameOfRuleParameter
            Source:
                Owner: Owner
                SourceIdentifier: SOURCE_IDENTIFIER
        Type: AWS::Config::ConfigRule
     ...
```

For example:

```
Resources:
    IamPasswordPolicy:
        Properties:
            ConfigRuleName: iam-password-policy
```

```
            InputParameters:
                MinimumPasswordLength: !Ref IamPasswordPolicyParamMinimumPasswordLength
            Source:
                Owner: AWS
                SourceIdentifier: IAM_PASSWORD_POLICY
        Type: AWS::Config::ConfigRule
```

> **Note**
>
> When selecting the AWS Config rules to build your custom conformance pack, check that you have the resources that will be evaluated for the AWS Config rules provisioned within your account. For more information, see Supported Resource Types.

1. Replace *NameOfRule* with the same name you created in the `Parameters` section.
2. For AWS Config Managed Rules, replace *ActualConfigRuleName* with the title of the appropriate rule page on the List of AWS Config Managed Rules. For AWS Config Custom Rules, use the Config Rule name you chose at the time of the rule's creation.
3. Replace *NameOfRuleParameter* with the same name you used in the `Parameters` section. After the colon, copy and paste the same concatenated string of `!Ref` + *NameOfRule* + Param + *NameOfRuleParameter* that you created in `Parameters` section.
4. Change *Owner* to the appropriate value.

   > **Note**
   >
   > **AWS Config Managed Rules**
   > For AWS Config Managed Rules, the value for `Owner` will be `AWS`.
   > **AWS Config Custom Rules**
   > For AWS Config custom rules created with Guard, the value for `Owner` will be `CUSTOM_POLICY`. For AWS Config custom rules created with Lambda, the value for `Owner` will be `CUSTOM_LAMBDA`.

5. Change *SOURCE_IDENTIFIER* to the appropriate value.

   > **Note**
   >
   > **AWS Config Managed Rules**

For AWS Config Managed Rules, copy the identifier by following the link from the rule you select from the List of AWS Config Managed Rules (for example, the source identifier for the **access-keys-rotated** rule is **ACCESS_KEYS_ROTATED**).

AWS Config Custom Rules

For AWS Config custom rules created with Lambda, the `SourceIdentifier` is the Amazon Resource Name (ARN) of the rule's AWS Lambda function, such as `arn:aws:lambda:us-east-2:123456789012:function:`*`ActualConfigRuleName`*. For AWS Config custom rules created with Guard, this field is not needed.

Altogether, your filled out custom conformance pack should begin to look similar to the following, which is an example using these AWS Config Managed Rules: **iam-password-policy**, **access-keys-rotated**, and **iam-user-unused-credentials-check**.

```
Parameters:
    IamPasswordPolicyParamMinimumPasswordLength:
        Default: '14'
        Type: String
    AccessKeysRotatedParamMaxAccessKeyAge:
        Default: '90'
        Type: String
    IamUserUnusedCredentialsCheckParamMaxCredentialUsageAge:
        Default: '45'
        Type: String
Resources:
    IamPasswordPolicy:
        Properties:
            ConfigRuleName: iam-password-policy
            InputParameters:
                MinimumPasswordLength: !Ref IamPasswordPolicyParamMinimumPasswordLength
            Source:
                Owner: AWS
                SourceIdentifier: IAM_PASSWORD_POLICY
        Type: AWS::Config::ConfigRule
    AccessKeysRotated:
        Properties:
            ConfigRuleName: access-keys-rotated
            InputParameters:
                maxAccessKeyAge: !Ref AccessKeysRotatedParamMaxAccessKeyAge
            Source:
```

```
                Owner: AWS
                SourceIdentifier: ACCESS_KEYS_ROTATED
        Type: AWS::Config::ConfigRule
    IamUserUnusedCredentialsCheck:
        Properties:
            ConfigRuleName: iam-user-unused-credentials-check
            InputParameters:
                maxCredentialUsageAge: !Ref
 IamUserUnusedCredentialsCheckParamMaxCredentialUsageAge
            Source:
                Owner: AWS
                SourceIdentifier: IAM_USER_UNUSED_CREDENTIALS_CHECK
        Type: AWS::Config::ConfigRule
```

Deploying Conformance Packs for AWS Config

You can use the AWS Config console or the AWS CLI to deploy your conformance packs.

Deploy Conformance Packs (Console)

On the **Conformance packs** page, you can deploy a conformance pack for an account in a Region. You can also edit and delete the deployed conformance pack.

You can deploy a conformance pack using AWS Config sample templates or your own custom template. For instructions on how to create personalized conformance packs, see Custom Conformance Pack.

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Navigate to the **Conformance packs** page and choose **Deploy conformance pack**.
3. On the **Specify template** page, either choose a sample template or use an existing template. For more information, see Conformance Pack Sample Templates.

   - If you choose **Use sample template**, select a **Sample template** from the dropdown list of sample templates.

     For information about the contents of each template, see Conformance Pack Sample Templates.

- If you choose **Template is ready**, specify the template source. It is either an Amazon S3 URI, an AWS Systems Manager document (SSM document), or a template that you upload.

  If your template is more than 50 KB, upload it to the S3 bucket and select that S3 bucket location. For example: s3://*bucketname/prefix*.

  > **Important**
  >
  > Choose **Template is ready** if you created your conformance pack YAML file from scratch based on Custom Conformance Pack.

4. Choose **Next**.
5. On the **Specify conformance pack details** page, enter the name for your conformance pack.

   The conformance pack name must be a unique name with a maximum of 256 alphanumeric characters. The name can contain hyphens but cannot contain spaces.
6. Optional: Add a parameter.

   Parameters are defined in your template and help you manage and organize your resources.
7. Choose **Next**.
8. On the **Review and deploy** page, review all of the information.

   You can edit the template details and conformance pack details by choosing **Edit**.
9. Choose **Deploy conformance pack**.

   AWS Config displays the conformance pack on the conformance pack page with the appropriate status.

   If your conformance pack deployment fails, check your permissions, verify that you did the prerequisite steps, and try again. Or you can contact AWS Support.

To deploy a **conformance pack using sample template with remediations**, see the A. Prerequisites for Using a Conformance Pack With Remediation and then use the preceding procedure.

To deploy a **conformance pack with one or more AWS Config rules**, see the B. Prerequisites for Using a Conformance Pack With One or More Custom AWS Config Rules.

Deploy Conformance Packs (AWS CLI)

1. Open a command prompt or a terminal window.
2. Enter one of the following commands to deploy a conformance pack named **`MyConformancePack`**. The template source is either an Amazon S3 URI, a template that you upload, or an AWS Systems Manager document (SSM document).

   Amazon S3 URI

   ```
   aws configservice put-conformance-pack
   --conformance-pack-name MyConformancePack
   --template-s3-uri "s3://amzn-s3-demo-bucket/templateName.yaml"
   --delivery-s3-bucket amzn-s3-demo-bucket
   ```

   YAML template from your local directory

   ```
   aws configservice put-conformance-pack
   --conformance-pack-name MyConformancePack
   --template-body template body
   ```

   AWS Systems Manager Document (Systems Manager Document)

   ```
   aws configservice put-conformance-pack
   --conformance-pack-name MyConformancePack
   --template-ssm-document-details
    DocumentName=SSMDocumentName,DocumentVersion=SSMDocumentVersion
   --delivery-s3-bucket amzn-s3-demo-bucket
   ```

3. Press Enter to run the command.

   You should see output similar to the following.

   ```
   {
       "conformancePackArn": "arn:aws:config:us-west-2:AccountID:conformance-pack/
   MyConformancePack1/conformance-pack-ID"
   }
   ```

> **Note**
>
> For more information on creating a YAML template for a conformance pack, see Custom Conformance Pack.

Editing Conformance Packs for AWS Config

You can use the AWS Config console or the AWS CLI to edit your conformance packs.

Editing Conformance Packs (Console)

1. To edit a conformance pack, select the conformance pack from the table.
2. Choose **Actions** and then choose **Edit**.
3. On the **Edit conformance pack** page, you can edit the template details, sample template, conformance pack, and parameters section.

   You cannot change the name of the conformance pack.
4. Choose **Save changes**.

   The conformance pack is displayed with the AWS Config rules.

Editing Conformance Packs (AWS CLI)

If you are editing a conformance pack that you added previously, use the same `PutConformancePack` command that you use when deploying a conformance pack.

1. Open a command prompt or a terminal window.
2. Enter one of the following commands to deploy a conformance pack named **`MyConformancePack`**. The template source is either an Amazon S3 URI, a template that you upload, or an AWS Systems Manager document (SSM document).

   Amazon S3 URI

   ```
   aws configservice put-conformance-pack
   --conformance-pack-name MyConformancePack
   --template-s3-uri "s3://amzn-s3-demo-bucket/templateName.yaml"
   --delivery-s3-bucket amzn-s3-demo-bucket
   ```

YAML template from your local directory

```
aws configservice put-conformance-pack
--conformance-pack-name MyConformancePack
--template-body template body
```

AWS Systems Manager Document (Systems Manager Document)

```
aws configservice put-conformance-pack
--conformance-pack-name MyConformancePack
--template-ssm-document-details
 DocumentName=SSMDocumentName,DocumentVersion=SSMDocumentVersion
--delivery-s3-bucket amzn-s3-demo-bucket
```

3. Press Enter to run the command.

   You should see output similar to the following.

```
{
    "conformancePackArn": "arn:aws:config:us-west-2:AccountID:conformance-pack/
MyConformancePack1/conformance-pack-ID"
}
```

> **Note**
>
> For more information on creating a YAML template for a conformance pack, see Custom Conformance Pack.

Deleting Conformance Packs for AWS Config

You can use the AWS Config console or the AWS CLI to delete conformance packs.

Considerations

Recommendation: Consider excluding the `AWS::Config::ResourceCompliance` resource type from recording before deleting rules

Deleting rules creates configuration items (CIs) for `AWS::Config::ResourceCompliance` that can affect your costs for the configuration recorder. If you are deleting rules which evaluate a large number of resource types, this can lead to a spike in the number of CIs recorded.

To avoid the associated costs, you can opt to disable recording for the `AWS::Config::ResourceCompliance` resource type before deleting rules, and re-enable recording after the rules have been deleted.

However, since deleting rules is an asynchronous process, it might take an hour or more to complete. During the time when recording is disabled for `AWS::Config::ResourceCompliance`, rule evaluations will not be recorded in the associated resource's history.

To delete a conformance pack

Deleting Conformance Packs (Console)

1. To delete a conformance pack, select the conformance pack from the table.
2. Choose **Actions** and then choose **Delete**.
3. On the delete *`conformance pack`* dialog box, confirm if you would like to permanently delete this conformance pack.

   > **Important**
   >
   > You cannot revert this action. When you delete a conformance pack, you delete all of the AWS Config rules and remediation actions in that conformance pack.

4. Enter **Delete** and choose **Delete**.

   On the **Conformance packs** page, you can see the deployment status as **Deleting** until the conformance pack is completely deleted.

Deleting Conformance Packs (AWS CLI)

Enter the following command.

```
aws configservice delete-conformance-pack --conformance-pack-name MyConformancePack1
```

If successful, the command runs with no additional output.

> **Important**
>
> You cannot revert this action. When you delete a conformance pack, you delete all of the AWS Config rules and remediation actions in that conformance pack.

Viewing Details and Compliance Information for your Conformance Packs for AWS Config

> **Important**
>
> For accurate reporting on the compliance status, you must record the `AWS::Config::ResourceCompliance` resource type. For more information, see Recording AWS Resources.

You can use the AWS Config console or the AWS CLI to view your conformance packs. The AWS Config console has a unified dashboard. The AWS CLI allows you to run commands for specific information.

Viewing Conformance Packs (Console)

To view your conformance packs in the AWS Management Console, see Conformance Pack Dashboard Pack.

Viewing the Details for your Conformance Packs (AWS CLI)

1. Enter the following command.

```
aws configservice describe-conformance-packs
```

OR

```
aws configservice describe-conformance-packs --conformance-pack-
name="MyConformancePack1"
```

2. You should see output similar to the following.

```
{
```

```
    "conformancePackName": "MyConformancePack1",
    "conformancePackId": "conformance-pack-ID",
    "conformancePackArn": "arn:aws:config:us-west-2:AccountID:conformance-
pack/MyConformancePack1/conformance-pack-ID",
    "conformancePackInputParameters": [],
    "lastUpdateRequestedTime": "Thu Jul 18 16:07:05 PDT 2019"
}
```

Viewing the Status for your Conformance Packs (AWS CLI)

1. Enter the following command.

```
aws configservice describe-conformance-pack-status --conformance-pack-
name="MyConformancePack1"
```

2. You should see output similar to the following .

```
{
    "stackArn": "arn:aws:cloudformation:us-west-2:AccountID:stack/
awsconfigconforms-MyConformancePack1-conformance-pack-ID/d4301fe0-
a9b1-11e9-994d-025f28dd83ba",
    "conformancePackName": "MyConformancePack1",
    "conformancePackId": "conformance-pack-ID",
    "lastUpdateCompletedTime": "Thu Jul 18 16:15:17 PDT 2019",
    "conformancePackState": "CREATE_COMPLETE",
    "conformancePackArn": "arn:aws:config:us-west-2:AccountID:conformance-
pack/MyConformancePack1/conformance-pack-ID",
    "lastUpdateRequestedTime": "Thu Jul 18 16:14:35 PDT 2019"
}
```

Viewing the Compliance Status for your Conformance Packs (AWS CLI)

1. Enter the following command.

```
aws configservice describe-conformance-pack-compliance --conformance-pack-
name="MyConformancePack1"
```

2. You should see output similar to the following.

```
{
```

```
    "conformancePackName": "MyConformancePack1",
    "conformancePackRuleComplianceList": [
        {
            "configRuleName": "awsconfigconforms-RuleName1-conformance-pack-ID",
            "complianceType": "NON_COMPLIANT"
        },
        {
            "configRuleName": "awsconfigconforms-RuleName2-conformance-pack-ID",
            "complianceType": "COMPLIANT"
        }
    ]
}
```

Viewing the Compliance Details for your Conformance Packs (AWS CLI)

1. Enter the following command.

```
aws configservice get-conformance-pack-compliance-details --conformance-pack-
name="MyConformancePack1"
```

2. You should see output similar to the following.

```
{
    "conformancePackRuleEvaluationResults": [
        {
            "evaluationResultIdentifier": {
                "orderingTimestamp": "Tue Jul 16 23:07:35 PDT 2019",
                "evaluationResultQualifier": {
                    "resourceId": "resourceID",
                    "configRuleName": "awsconfigconforms-RuleName1-conformance-
pack-ID",

           "configRuleInvokedTime": "Thu Jul 11 23:08:06 PDT 2019",
            "resultRecordedTime": "Thu Jul 11 23:08:06 PDT 2019",
            "complianceType": "COMPLIANT"
        }
    ],
    "conformancePackName": "MyConformancePack1"
}
}
```

Viewing the Compliance History Timeline for Conformance Packs for AWS Config

AWS Config supports storing compliance state changes to your conformance packs. This allows you to view the history of compliance state changes. These compliance state changes are presented as a timeline. The timeline captures changes as `ConfigurationItems` over a period of time. You can also use this feature to find specific rules within a conformance pack that are noncompliant.

You can opt in or out to record all resource types in AWS Config. If you have opted to record all resource types, AWS Config automatically begins recording the conformance pack compliance history as evaluated by AWS Config Rules. By default, AWS Config records the configuration changes for all supported resources. You can also select only the specific conformance pack compliance history resource type: `AWS::Config::ConformancePackCompliance`. Recording for the `AWS::Config::ConformancePackCompliance` resource type is available at no additional charge. For more information, see Recording AWS Resources.

A conformance pack is compliant if all of the rules in a conformance packs are compliant. It is noncompliant if any of the rules are not compliant. The compliance status of a conformance pack is INSUFFICIENT_DATA only if all rules within a conformance pack cannot be evaluated due to insufficient data. If some of the rules in a conformance pack are compliant but the compliance status of other rules in that same conformance pack is INSUFFICIENT_DATA, the conformance pack shows compliant. Compliance for a conformance pack is not evaluated all at one time. Some rules

may take a longer time to evaluate than others. Compliance is evaluated for groups of rules at a time, continuing in stages until all the rules in a conformance pack have been evaluated.

Viewing the Compliance Timeline

Access the compliance timeline by selecting a specific conformance pack from the **Conformance pack** main page.

1. Navigate to the **Conformance Pack** page.
2. On the **Conformance Pack** main page, choose a specific conformance pack and then choose **Conformance pack timeline** .

> **Note**
>
> Alternatively, you can use the compliance timeline from the conformance pack's details page. Choose a conformance pack and choose **View details** in the **Actions** dropdown. From this page, choose **Conformance pack timeline**.

The timeline shows you the history of compliance state changes for a conformance pack. You can do the following:

1. Expand a compliance change to view the line-by-line compliance status of each rule within a conformance pack.
2. From the expanded view, choose a specific rule to view its details page.

Querying Compliance History for Conformance Packs for AWS Config

Query the compliance history using get-resource-config-history using the resource type `AWS::Config::ConformancePackCompliance`.

```
aws configservice get-resource-config-history --resource-type
 AWS::Config::ConformancePackCompliance --resource-id conformance-pack-ID
```

You should see output similar to the following:

```
{
    "configurationItems": [
        {
            "version": "1.3",
            "accountId": "Account ID",
            "configurationItemCaptureTime": 1614641951.442,
            "configurationItemStatus": "OK",
            "configurationStateId": "1614641951442",
            "configurationItemMD5Hash": "",
            "arn": "arn:aws:config:us-east-1:Account ID:conformance-
pack/MyConformancePack1/conformance-pack-ID",

\"totalRuleCount\":3,\"nonCompliantRuleCount\":0,\"complianceType\":\"COMPLIANT\"}",
            "supplementaryConfiguration": {}
        }
    ]
}
```

For more information, see Supported Resource Types (AWS Config) and GetResourceConfigHistory in the API reference.

Managing Conformance Packs for AWS Config Across all Accounts in Your Organization

Use AWS Config to manage conformance packs across all AWS accounts within an organization. You can do the following:

- Centrally deploy, update, and delete conformance packs across member accounts in an organization in AWS Organizations.
- Deploy a common set of AWS Config rules and remediation actions across all accounts and specify accounts where AWS Config rules and remediation actions should not be created.
- Use the management account in AWS Organizations to enforce governance by ensuring that the underlying AWS Config rules and remediation actions are not modifiable by your organization's member accounts.

Considerations

For deployments across different regions

The API call to deploy rules and conformance packs across accounts is AWS Region specific. At the organization level, you need to change the context of your API call to a different region if you want to deploy rules in other regions. For example, to deploy a rule in US East (N. Virginia), change the region to US East (N. Virginia) and then call `PutOrganizationConfigRule`.

For accounts within an organization

If a new account joins an organization, the rule or conformance pack is deployed to that account. When an account leaves an organization, the rule or conformance pack is removed.

If you deploy an organizational rule or conformance pack in an organization administrator account, and then establish a delegated administrator and deploy an organizational rule or conformance pack in the delegated administrator account, you won't be able to see the organizational rule or conformance pack in the organization administrator account from the delegated administrator account or see the organizational rule or conformance pack in the delegated administrator account from organization administrator account. The DescribeOrganizationConfigRules and DescribeOrganizationConformancePacks APIs can only see and interact with the organization-related resource that were deployed from within the account calling those APIs.

Retry mechanism for new accounts added to an organization

Deployment of existing organizational rules and conformance packs will only be retried for 7 hours after an account is added to your organization if a recorder is not available. You are expected to create a recorder if one doesn't exist within 7 hours of adding an account to your organization.

Organization management accounts, delegated administrators, and service-linked roles

If you are using an organization management account and intend to use a delegated administrator for organizational deployment, be aware that AWS Config won't automatically create the service-linked role (SLR). You must manually create the service-linked role (SLR) separately using IAM.

If you do not have an SLR for your management account, you will not be able to deploy resources to that account from a delegated administrator account. You will still be able to deploy conformance packs to member accounts from management and delegated administrator accounts. For more information, see Using service-linked roles in the *AWS Identity and Access Management (IAM) User Guide*.

Deployment

To deploy with the AWS Management Console

To a deploy a conformance pack across an organization from the AWS console, use AWS Systems Manager. For more information, see Deploy AWS Config conformance packs in the *AWS Systems Manager User Guide*.

To deploy with the AWS API

For information on how to integrate AWS Config with AWS Organizations, see AWS Config and AWS Organizations in the *AWS Organizations User Guide*. Ensure AWS Config recording is on before you use the following APIs to manage conformance pack rules across all AWS accounts within an organization:

- DeleteOrganizationConformancePack, deletes the specified organization conformance pack and all of the config rules and remediation actions from all member accounts in that organization.
- DescribeOrganizationConformancePacks, returns a list of organization conformance packs.
- DescribeOrganizationConformancePackStatuses, provides organization conformance pack deployment status for an organization.
- GetOrganizationConformancePackDetailedStatus, returns detailed status for each member account within an organization for a given organization conformance pack.
- PutOrganizationConformancePack, deploys conformance packs across member accounts in an AWS Organization.

Region Support

Deploying conformance packs across member accounts in an AWS Organization is supported in the following Regions.

Region Name	Region	Endpoint	Protocol	
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS	

Region Name	Region	Endpoint	Protocol
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com	HTTPS
US West (N. California)	us-west-1	config.us-west-1.amazonaws.com	HTTPS
US West (Oregon)	us-west-2	config.us-west-2.amazonaws.com	HTTPS
Africa (Cape Town)	af-south-1	config.af-south-1.amazonaws.com	HTTPS
Asia Pacific (Hong Kong)	ap-east-1	config.ap-east-1.amazonaws.com	HTTPS
Asia Pacific (Hyderabad)	ap-south-2	config.ap-south-2.amazonaws.com	HTTPS
Asia Pacific (Jakarta)	ap-southeast-3	config.ap-southeast-3.amazonaws.com	HTTPS
Asia Pacific (Malaysia)	ap-southeast-5	config.ap-southeast-5.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
Asia Pacific (Melbourne)	ap-southeast-4	config.ap-southeast-4.amazonaws.com	HTTPS
Asia Pacific (Mumbai)	ap-south-1	config.ap-south-1.amazonaws.com	HTTPS
Asia Pacific (New Zealand)	ap-southeast-6	config.ap-southeast-6.amazonaws.com	HTTPS
Asia Pacific (Osaka)	ap-northeast-3	config.ap-northeast-3.amazonaws.com	HTTPS
Asia Pacific (Seoul)	ap-northeast-2	config.ap-northeast-2.amazonaws.com	HTTPS
Asia Pacific (Singapore)	ap-southeast-1	config.ap-southeast-1.amazonaws.com	HTTPS
Asia Pacific (Sydney)	ap-southeast-2	config.ap-southeast-2.amazonaws.com	HTTPS
Asia Pacific (Taipei)	ap-east-2	config.ap-east-2.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
Asia Pacific (Thailand)	ap-southeast-7	config.ap-southeast-7.amazonaws.com	HTTPS
Asia Pacific (Tokyo)	ap-northeast-1	config.ap-northeast-1.amazonaws.com	HTTPS
Canada (Central)	ca-central-1	config.ca-central-1.amazonaws.com	HTTPS
Canada West (Calgary)	ca-west-1	config.ca-west-1.amazonaws.com	HTTPS
Europe (Frankfurt)	eu-central-1	config.eu-central-1.amazonaws.com	HTTPS
Europe (Ireland)	eu-west-1	config.eu-west-1.amazonaws.com	HTTPS
Europe (London)	eu-west-2	config.eu-west-2.amazonaws.com	HTTPS
Europe (Milan)	eu-south-1	config.eu-south-1.amazonaws.com	HTTPS
Europe (Paris)	eu-west-3	config.eu-west-3.amazonaws.com	HTTPS
Europe (Spain)	eu-south-2	config.eu-south-2.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
Europe (Stockholm)	eu-north-1	config.eu-north-1.amazonaws.com	HTTPS
Europe (Zurich)	eu-central-2	config.eu-central-2.amazonaws.com	HTTPS
Israel (Tel Aviv)	il-central-1	config.il-central-1.amazonaws.com	HTTPS
Mexico (Central)	mx-central-1	config.mx-central-1.amazonaws.com	HTTPS
Middle East (Bahrain)	me-south-1	config.me-south-1.amazonaws.com	HTTPS
Middle East (UAE)	me-central-1	config.me-central-1.amazonaws.com	HTTPS
South America (São Paulo)	sa-east-1	config.sa-east-1.amazonaws.com	HTTPS
AWS GovCloud (US-East)	us-gov-east-1	config.us-gov-east-1.amazonaws.com	HTTPS
AWS GovCloud (US-West)	us-gov-west-1	config.us-gov-west-1.amazonaws.com	HTTPS

Troubleshooting for Conformance Packs for AWS Config

Check the following issues to help troubleshoot issues you might run into when using conformance packs.

Topics

- Failed status for a conformance pack
- Dangling rules in a conformance pack

Failed status for a conformance pack

If you get an error indicating that the conformance pack failed while creating, updating, or deleting it, you can check the status of your conformance pack.

```
aws configservice describe-conformance-pack-status --conformance-pack-name
 MyConformancePack1
```

You should see output similar to the following.

```
"ConformancePackStatusDetails": [
    {
        "ConformancePackName": "ConformancePackName",
        "ConformancePackId": "ConformancePackId",
        "ConformancePackArn": "ConformancePackArn",
        "ConformancePackState": "CREATE_FAILED",
        "StackArn": "CloudFormation stackArn",
        "ConformancePackStatusReason": "Failure Reason",
        "LastUpdateRequestedTime": 1573865201.619,
        "LastUpdateCompletedTime": 1573864244.653
    }
]
```

Check the **ConformancePackStatusReason** for information about the failure.

When the stackArn is present in the response

If the error message is not clear or if the failure is due to an internal error, go to the CloudFormation console and do the following:

1. Search for the **stackArn** from the output.
2. Choose the **Events** tab of the CloudFormation stack and check for failed events.

   The status reason indicates why the conformance pack failed.

When the stackArn is not present in the response

If you receive a failure while you create a conformance pack but the stackArn is not present in the status response, the possible reason is that the stack creation failed and CloudFormation rolled back and deleted the stack. Go to the CloudFormation console and search for stacks that are in a **Deleted** state. The failed stack might be available there. The CloudFormation stack contains the conformance pack name. If you find the failed stack, choose the **Events** tab of the CloudFormation stack and check for failed events.

If none of these steps worked and if the failure reason is an internal service error, then try operation again or contact the AWS Support Center.

Dangling rules in a conformance pack

Deploying a conformance pack involves the creation of an underlying AWS CloudFormation stack in the background to deploy the rules in the conformance pack template. These rules are service-linked rules and cannot be updated or deleted outside the conformance pack.

If you make changes to the underlying CloudFormation stack, this results in a situation where the conformance pack and its rules become unmanageable. These unmanageable rules are *dangling rules*.

Drift between the CloudFormation stack and the conformance pack

You can update the rule names in a conformance pack template directly from the CloudFormation console. If you update the template directly from the CloudFormation console, this does not update the deployed conformance pack.

This drift creates a dangling rule. If you try to delete the rule from the conformance pack, you receive an error similiar to the following:

```
"An AWS service owns ServiceLinkedConfigRule. You do not have permissions to
 take action on this rule. (Service: AmazonConfig; Status Code: 400; Error Code:
 AccessDeniedException; Request ID: my-request-ID; Proxy: null)".
```

If you try to delete the conformance pack, the dangling rule cannot be deleted and you receive an error similiar to the following:

```
"User: arn:aws:sts::111122223333:assumed-role/AWSServiceRoleForConfigConforms/
AwsConfigConformsWorkflow is not authorized to perform: config:DeleteConfigRule on
 resource: my-dangling-rule
```

To fix this issue, do the following steps:

1. Delete the stack. For more information, see Deleting a stack on the CloudFormation console in the *CloudFormation User Guide*.
2. Delete the conformance pack using the AWS Config console or using the DeleteConformancePack API. If it is an organizational conformance pack and you are using the management or delegated administrator account, use the DeleteOrganizationConformancePack API.
3. Reach out to the AWS Support Center with the Amazon Resource Name (ARN) of the dangling rules in the conformance pack to help clean up your account.

To avoid this issue, remember these best practices:

- Never make any direct updates to the CloudFormation stack of a conformance pack.
- Never try and make changes which create drift between the conformance pack and its underlying CloudFormation stack.
- The service-linked role (SLR) for conformance packs cannot be modified. Make sure the resources you are updating are part of the permissions policy for the SLR.

Deleted CloudFormation stack for a conformance pack

Unless there is drift between the CloudFormation stack and the conformance pack, it is never recommended to delete rules in a conformance pack or its CloudFormation stack directly from the CloudFormation console.

To fix this issue, reach out to the AWS Support Center with the Amazon Resource Name (ARN) of the dangling rules in the conformance pack to help clean up your account.

To avoid this issue, remember these best practices:

- Never delete the underlying CloudFormation stack for a conformance pack.

- Delete conformance packs using the DeleteConformancePack API. If it is an organizational conformance pack and you are using the management or delegated administrator account, use the DeleteOrganizationConformancePack API.

Remediating Noncompliant Resources with AWS Config

AWS Config allows you to remediate noncompliant resources that are evaluated by AWS Config Rules. AWS Config applies remediation using AWS Systems Manager Automation documents. These documents define the actions to be performed on noncompliant AWS resources evaluated by AWS Config Rules. You can associate SSM documents by using AWS Management Console or by using APIs.

AWS Config provides a set of managed automation documents with remediation actions. You can also create and associate custom automation documents with AWS Config rules.

Topics

- Region Support
- Setting Up Manual Remediation for AWS Config
- Setting Up Auto Remediation for AWS Config
- Deleting Remediation Actions for AWS Config

Region Support

Currently, remediation actions for AWS Config Rules is supported in the following regions:

Region Name	Region	Endpoint	Protocol
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com	HTTPS
US West (N. California)	us-west-1	config.us-west-1.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
US West (Oregon)	us-west-2	config.us-west-2.amazonaws.com	HTTPS
Africa (Cape Town)	af-south-1	config.af-south-1.amazonaws.com	HTTPS
Asia Pacific (Hong Kong)	ap-east-1	config.ap-east-1.amazonaws.com	HTTPS
Asia Pacific (Hyderabad)	ap-south-2	config.ap-south-2.amazonaws.com	HTTPS
Asia Pacific (Jakarta)	ap-southeast-3	config.ap-southeast-3.amazonaws.com	HTTPS
Asia Pacific (Melbourne)	ap-southeast-4	config.ap-southeast-4.amazonaws.com	HTTPS
Asia Pacific (Mumbai)	ap-south-1	config.ap-south-1.amazonaws.com	HTTPS
Asia Pacific (Osaka)	ap-northeast-3	config.ap-northeast-3.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
Asia Pacific (Seoul)	ap-northeast-2	config.ap-northeast-2.amazonaws.com	HTTPS
Asia Pacific (Singapore)	ap-southeast-1	config.ap-southeast-1.amazonaws.com	HTTPS
Asia Pacific (Sydney)	ap-southeast-2	config.ap-southeast-2.amazonaws.com	HTTPS
Asia Pacific (Tokyo)	ap-northeast-1	config.ap-northeast-1.amazonaws.com	HTTPS
Canada (Central)	ca-central-1	config.ca-central-1.amazonaws.com	HTTPS
Canada West (Calgary)	ca-west-1	config.ca-west-1.amazonaws.com	HTTPS
Europe (Frankfurt)	eu-central-1	config.eu-central-1.amazonaws.com	HTTPS
Europe (Ireland)	eu-west-1	config.eu-west-1.amazonaws.com	HTTPS
Europe (London)	eu-west-2	config.eu-west-2.amazonaws.com	HTTPS
Europe (Milan)	eu-south-1	config.eu-south-1.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
Europe (Paris)	eu-west-3	config.eu-west-3.amazonaws.com	HTTPS
Europe (Spain)	eu-south-2	config.eu-south-2.amazonaws.com	HTTPS
Europe (Stockholm)	eu-north-1	config.eu-north-1.amazonaws.com	HTTPS
Europe (Zurich)	eu-central-2	config.eu-central-2.amazonaws.com	HTTPS
Israel (Tel Aviv)	il-central-1	config.il-central-1.amazonaws.com	HTTPS
Middle East (Bahrain)	me-south-1	config.me-south-1.amazonaws.com	HTTPS
Middle East (UAE)	me-central-1	config.me-central-1.amazonaws.com	HTTPS
South America (São Paulo)	sa-east-1	config.sa-east-1.amazonaws.com	HTTPS
AWS GovCloud (US-East)	us-gov-east-1	config.us-gov-east-1.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol	
AWS GovCloud (US-West)	us-gov-west-1	config.us-gov-west-1.amazonaws.com	HTTPS	

Setting Up Manual Remediation for AWS Config

To apply remediation on noncompliant resources, you can either choose the remediation action you want to associate from a prepopulated list or create your own custom remediation actions using SSM documents. AWS Config provides a recommended list of remediation action in the AWS Management Console.

Setting Up Manual Remediation (Console)

In the AWS Management Console, you can either choose to manually remediate noncompliant resources by associating remediation actions with AWS Config rules. With all remediation actions, you can either choose manual or automatic remediation.

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Rules** on the left and then on the **Rules** page, choose **Add Rule** to add new rules to the rule list

   For existing rules, select the noncompliant rule from the rule list and choose the **Actions** dropdown list.
3. From the **Actions** dropdown list, choose **Manage remediation**. Select "Manual remediation" and then choose the appropriate remediation action from the recommended list.

> **Note**
>
> You can only manage remediations for non-service linked AWS Config rules. For more information, see Service-Linked AWS Rules.

Depending on the selected remediation action, you see specific parameters or no parameters.

4. (Optional): If you want to pass the resource ID of noncompliant resources to the remediation action, choose **Resource ID parameter**. If selected, at runtime that parameter is substituted with the ID of the resource to be remediated.

   Each parameter has either a static value or a dynamic value. If you do not choose a specific resource ID parameter from the dropdown list, you can enter values for each key. If you choose a resource ID parameter from the dropdown list, you can enter values for all the other keys except the selected resource ID parameter.

5. Choose **Save**. The **Rules** page is displayed.

For troubleshooting failed remediation actions, you can run the AWS Command Line Interface command `describe-remediation-execution-status` to get detailed view of a Remediation Execution for a set of resources. The details include state, timestamps for remediation execution steps, and any error messages for the failed steps.

Setting Up Manual Remediation (API)

Use the following AWS Config API operation to set up manual remediation:

- PutRemediationConfigurations, adds or updates the remediation configuration with a specific AWS Config rule with the selected target or action.
- StartRemediationExecution, runs an on-demand remediation for the specified AWS Config rules against the last known remediation configuration.
- DescribeRemediationExecutionStatus, provides a detailed view of a Remediation Execution for a set of resources including state, timestamps for when steps for the remediation execution occur, and any error messages for steps that have failed.
- DescribeRemediationConfigurations, returns the details of one or more remediation configurations.

Setting Up Auto Remediation for AWS Config

To apply remediation on noncompliant resources, you can either choose the remediation action you want to associate from a prepopulated list or create your own custom remediation actions

using SSM documents. AWS Config provides a list of remediation action in the AWS Management Console.

Setting Up Auto Remediation (Console)

In the AWS Management Console, you can either choose to automatically remediate noncompliant resources by associating remediation actions with AWS Config rules. With all remediation actions, you can either choose manual or automatic remediation.

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Rules** on the left and then on the **Rules** page, choose **Add Rule** to add new rules to the rule list.

   For existing rules, select the noncompliant rule from the rule list and choose the **Actions** dropdown list.
3. From the **Actions** dropdown list, choose **Manage remediation**. Select "Automatic remediation" and then choose the appropriate remediation action from the list.

   > **Note**
   >
   > You can only manage remediations for non-service linked AWS Config rules. For more information, see Service-Linked AWS Rules.

   Depending on the selected remediation action, you see specific parameters or no parameters.
4. Choose **Auto remediation** to automatically remediate noncompliant resources.

   If a resource is still noncompliant after auto remediation, you can set the rule to try auto remediation again. Enter the desired retries and seconds.

   > **Note**
   >
   > There are costs associated with running a remediation script multiple times. Retries only occur if remediation fails and work within the specified time period; for example, 5 retries in 300 seconds. For more information, see Systems Manager Automation Pricing .

5. (Optional): If you want to pass the resource ID of noncompliant resources to the remediation action, choose **Resource ID parameter**. If selected, at runtime that parameter is substituted with the ID of the resource to be remediated.

   Each parameter has either a static value or a dynamic value. If you do not choose a specific resource ID parameter from the dropdown list, you can enter values for each key. If you choose a resource ID parameter from the dropdown list, you can enter values for all the other keys except the selected resource ID parameter.

6. Choose **Save**. The **Rules** page is displayed.

For troubleshooting failed remediation actions

For troubleshooting failed remediation actions, you can run the AWS Command Line Interface command `describe-remediation-execution-status` to get detailed view of a Remediation Execution for a set of resources. The details include state, timestamps for remediation execution steps, and any error messages for the failed steps.

Auto remediation can be initiated even for compliant resources

If you enable auto remediation for a specific AWS Config rule using the PutRemediationConfigurations API or the AWS Config console, it initiates the remediation process for all noncompliant resources for that specific rule. The auto remediation process relies on the compliance data snapshot which is captured on a periodic basis. Any noncompliant resource that is updated between the snapshot schedule will continue to be remediated based on the last known compliance data snapshot.

This means that in some cases auto remediation can be initiated even for compliant resources, since the bootstrap processor uses a database that can have stale evaluation results based on the last known compliance data snapshot.

Setting Up Auto Remediation (API)

Use the following AWS Config API operation to set up auto remediation:

- PutRemediationExceptions, adds a new exception or updates an existing exception for a specific resource with a specific AWS Config rule.
- DescribeRemediationExceptions, returns the details of one or more remediation exceptions.

Deleting Remediation Actions for AWS Config

You can use the AWS Config console or the AWS CLI to delete remediation actions.

Deleting remediation actions (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Rules** on the left and then on the **Rules** page, select the rule from the rule list and choose **View details**.
3. On the *name of the rule* page, go to the **Remediation action** section. Expand the section to view additional details.
4. In the **Remediation action** section, choose **Delete** and confirm your delete action.

   > **Note**
   >
   > If remediation is in progress, a remediation action won't be deleted. Once you choose delete a remediation action, you cannot retrieve the remediation action. Deleting a remediation action does not delete the associated rule.

   If a remediation action is deleted, the **Resource ID parameter** will be empty and display N/A. On the **Rules** page, the remediation action column displays **Not set** for the associated rule.

Deleting remediation actions (API)

Use the following AWS Config API operation to set up auto remediation:

- DeleteRemediationConfiguration, deletes the remediation configuration.
- DeleteRemediationExceptions, deletes one or more remediation exceptions mentioned in the resource keys.

Multi-Account Multi-Region Data Aggregation for AWS Config

An aggregator is an AWS Config resource type that collects AWS Config configuration and compliance data from the following:

- Multiple accounts and multiple AWS Regions.
- Single account and multiple AWS Regions.
- An organization in AWS Organizations and all the accounts in that organization which have AWS Config enabled.

Use an aggregator to view the resource configuration and compliance data recorded in AWS Config. The following image displays how an aggregator collects AWS Config data from multiple accounts and Regions.

Use Cases

- **Compliance Monitoring**: You can aggregate compliance data to assess the overall compliance postures of your organization, or across accounts and Regions.
- **Change Tracking**: You can track changes to resources over time across your organization, or across accounts and Regions.

- **Resource Relationships**: You can analyze resource dependencies and relationships across your organization, or across accounts and Regions.

> **Note**
>
> Aggregators provide a *read-only view* into the source accounts and Regions that the aggregator is authorized to view by replicating data from the source accounts into the aggregator account. Aggregators do not provide mutating access into a source account or region. For example, this means that you cannot deploy rules through an aggregator or push snapshot files to a source account or region through an aggregator.
> Using aggregators does not incur any additional costs.

Terminology

A *source account* is the AWS account from which you want to aggregate AWS Config resource configuration and compliance data. A source account can be an individual account or an organization in AWS Organizations. You can provide source accounts individually or you can retrieve them through AWS Organizations.

A *source region* is the AWS Region from which you want to aggregate AWS Config configuration and compliance data.

An *aggregator account* is an account where you create an aggregator.

Authorization refers to the permissions you grant to an aggregator account and region to collect your AWS Config configuration and compliance data. Authorization is not required if you are aggregating source accounts that are part of AWS Organizations.

A *service-linked aggregator* is linked to a specific AWS service. The configuration and compliance data in scope are set by the linked service.

Region Support

Currently, multi-account multi-region data aggregation is supported in the following Regions:

Region Name	Region	Endpoint	Protocol	
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS	
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com	HTTPS	
US West (N. California)	us-west-1	config.us-west-1.amazonaws.com	HTTPS	
US West (Oregon)	us-west-2	config.us-west-2.amazonaws.com	HTTPS	
Africa (Cape Town)	af-south-1	config.af-south-1.amazonaws.com	HTTPS	
Asia Pacific (Hong Kong)	ap-east-1	config.ap-east-1.amazonaws.com	HTTPS	
Asia Pacific (Hyderabad)	ap-south-2	config.ap-south-2.amazonaws.com	HTTPS	
Asia Pacific (Jakarta)	ap-southeast-3	config.ap-southeast-3.amazonaws.com	HTTPS	
Asia Pacific	ap-southeast-5	config.ap-southeast-5.amazonaws.com	HTTPS	

Region Name	Region	Endpoint	Protocol
(Malaysia)			
Asia Pacific (Melbourne)	ap-southeast-4	config.ap-southeast-4.amazonaws.com	HTTPS
Asia Pacific (Mumbai)	ap-south-1	config.ap-south-1.amazonaws.com	HTTPS
Asia Pacific (New Zealand)	ap-southeast-6	config.ap-southeast-6.amazonaws.com	HTTPS
Asia Pacific (Osaka)	ap-northeast-3	config.ap-northeast-3.amazonaws.com	HTTPS
Asia Pacific (Seoul)	ap-northeast-2	config.ap-northeast-2.amazonaws.com	HTTPS
Asia Pacific (Singapore)	ap-southeast-1	config.ap-southeast-1.amazonaws.com	HTTPS
Asia Pacific (Sydney)	ap-southeast-2	config.ap-southeast-2.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol	
Asia Pacific (Taipei)	ap-east-2	config.ap-east-2.amazonaws.com	HTTPS	
Asia Pacific (Thailand)	ap-southeast-7	config.ap-southeast-7.amazonaws.com	HTTPS	
Asia Pacific (Tokyo)	ap-northeast-1	config.ap-northeast-1.amazonaws.com	HTTPS	
Canada (Central)	ca-central-1	config.ca-central-1.amazonaws.com	HTTPS	
Canada West (Calgary)	ca-west-1	config.ca-west-1.amazonaws.com	HTTPS	
Europe (Frankfurt)	eu-central-1	config.eu-central-1.amazonaws.com	HTTPS	
Europe (Ireland)	eu-west-1	config.eu-west-1.amazonaws.com	HTTPS	
Europe (London)	eu-west-2	config.eu-west-2.amazonaws.com	HTTPS	
Europe (Milan)	eu-south-1	config.eu-south-1.amazonaws.com	HTTPS	
Europe (Paris)	eu-west-3	config.eu-west-3.amazonaws.com	HTTPS	

Region Name	Region	Endpoint	Protocol	
Europe (Spain)	eu-south-2	config.eu-south-2.amazonaws.com	HTTPS	
Europe (Stockholm)	eu-north-1	config.eu-north-1.amazonaws.com	HTTPS	
Europe (Zurich)	eu-central-2	config.eu-central-2.amazonaws.com	HTTPS	
Israel (Tel Aviv)	il-central-1	config.il-central-1.amazonaws.com	HTTPS	
Mexico (Central)	mx-central-1	config.mx-central-1.amazonaws.com	HTTPS	
Middle East (Bahrain)	me-south-1	config.me-south-1.amazonaws.com	HTTPS	
Middle East (UAE)	me-central-1	config.me-central-1.amazonaws.com	HTTPS	
South America (São Paulo)	sa-east-1	config.sa-east-1.amazonaws.com	HTTPS	
AWS GovCloud (US-East)	us-gov-east-1	config.us-gov-east-1.amazonaws.com	HTTPS	

Region Name	Region	Endpoint	Protocol	
AWS GovCloud (US-West)	us-gov-west-1	config.us-gov-west-1.amazonaws.com	HTTPS	

Viewing Compliance and Inventory Data in the Aggregator Dashboard for AWS Config

The dashboard on the **Aggregators** page displays the configuration data of your aggregated AWS resources. It provides an overview of your rules, conformance packs, and their compliance states.

The dashboard provides the total resource count of AWS resources. The resource types and source accounts are ranked by the highest number of resources. It also provides a count of compliant and noncompliant rules and conformance packs. The noncompliant rules are ranked by highest number of noncompliant resources. The noncompliant conformance packs and source accounts are ranked by the highest number of noncompliant rules.

After setting up AWS Config, it starts aggregating data from the specified source accounts into an aggregator. It might take a few minutes for the compliance status of rules to display.

Using the Aggregator Dashboard

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Navigate to the **Aggregators** page. You can view:
   - Your rules and their compliance states.
   - Your conformance packs and their compliance states.
   - Your AWS resources and their configuration data.
3. Choose an aggregator from the dashboard. Filter through your aggregators by aggregator name. You can view the following widgets:
   - **Resource inventory**

View the top 10 resource types from the selected aggregator, in descending order by the resource count. Choose the total number of resources for the selected aggregator, displayed in parentheses after **Resource inventory**, to go to the aggregated **Resources** page, where you can view all the resources for an aggregator. Alternatively, choose a resource type in the widget to go to the aggregated **Resources** page, filtered using the specified resource type.

- **Accounts by resource count**

  View the top five accounts from the selected aggeregator in the descending order by the resource count. Choose an account in the widget to go to the **Resources** page, filtered using the specified account.

- **Noncompliant rules**

  View the top five noncompliant rules from the selected Aggregator, in descending order by the number of noncompliant resources. Choose a rule in the widget to go to the details page for the specified rule. Choose **View all noncompliant rules** to go to the aggregated **Rules** page, where you can view all the rules for an aggregator.

- **Accounts by noncompliant rules**

  View the top five accounts from the selected aggregator, in descending order by the number of noncompliant rules. Choose an account in the widget to go to the aggregated **Rules** page, where you can view all the rules for an aggregator filtered using the specified account.

- **Accounts by noncompliant conformance packs**

  View the top five accounts from the selected aggregagtor, in descending order by the number of noncompliant conformance packs. Choose an account in the widget to go to the aggregated **Conformance Pack** page, where you can view all conformance packs for an aggregagtor filtered using the specified account.

4. In the left navigation pane, choose one of the following options from the dropdown menu:

   - **Compliance dashboard**

     View automated compliance dashboards by using the widgets that summarize insights about resource compliance within your aggregator. You can see data such as the top 10 resource types by noncompliant resources, and top 10 account level conformance packs by noncompliant rules. For information about these graphs and charts, see Compliance dashboards.

   - **Conformance packs**

View all conformance packs that are created and linked to the different AWS accounts within your aggregator. The **Conformance Pack** page displays a table that lists the name, Region, account ID, and compliance status of each conformance pack. From this page, you can choose a conformance pack and **View details** for more information about its rules and resources and their compliance status.

- **Rules**

  View all rules that are created and linked to the different AWS accounts within your aggregator. The **Rules** page displays a table that lists the name, compliance status, Region, and account of each rule. From this page, you can choose a rule and **View details** for information, such as its aggregator, Region, account ID, and resources in scope.

- **Inventory dashboard**

  View automated inventory dashboards by using the widgets that summarize insights about resource configuration data within your aggregator. You can see data such as the top 10 resource types by resource count, and the top 10 accounts by resource count. For information about these graphs and charts, see Inventory dashboards.

- **Resources**

  View all resources that are recorded and linked to the different AWS accounts within your aggregator. From the **Resource** page, choose a resource and **View details** to view its details, the rules associated with it, and the current resource configuration. You can also see information about the resource, such as its aggregator, Region, account ID, resource name, resource type, and resource ID.

- **Authorizations**

  View and manage all accounts currently authorized or pending authorization. From the **Authorizations** page, choose **Add authorization** to provide access to another account. Choose **Delete authorization** to revoke access from an account ID.

> **Note**
>
> **Troubleshooting**
>
> You might see the **Data collection from all source accounts and regions is incomplete** message displayed in the aggregated view for the following reasons:

- The transfer of noncompliant AWS Config rules and configuration data of AWS resources is in progress.
- AWS Config can't find rules to match the filter that you applied. Select the appropriate account or Region, and try again.

You might see this message display in the aggregated view: **Data collection from your organization is incomplete. You can view the below data only for 24 hours.** It displays for the following reasons:

- AWS Config can't access your organization details because of an IAM role that is not valid. If the IAM role remains not valid for more than 24 hours, AWS Config deletes the data for the entire organization.
- AWS Config service access is disabled in your organization.

Compliance Dashboard

View automated compliance dashboards by using widgets that summarize insights about resource compliance within your aggregator This dashboard displays only rules with compliance results.

Note

Limitations

The insights in the compliance dashboard are provided by the Advanced Queries feature of AWS Config, and this feature does not support nested structures or unpacking nested arrays. This means that the compliance dashboard displays the overall compliance of a resource and not the compliance status for each specific rule which reports on a resource. For example, if you check the configuration item (CI) for the resource type `AWS::Config::ResourceCompliance`, the dashboard will display the compliance results for all the rules that report on that resource. If there are 10 rules that report on the resource, 9 of them are COMPLIANT, and only 1 is NON_COMPLIANT, the overall compliance of that resource will be NON_COMPLIANT.

Compliance Summary By Resources

Displays a pie chart comparing the number of compliant resources to noncompliant resources from the selected aggregator. Hover over the chart to see the exact number and percentage of compliant and noncompliant resources.

The data displayed depends on the settings of the configuration recorder for each account in the selected aggregator, and the Regions where the selected aggregator is configured to collect data.

Top 10 resource types by noncompliant resources

Displays a horizontal bar graph comparing up to 10 resource types from the selected aggregator in descending order by the number of noncompliant resources. Hover over the graph to see the exact number of noncompliant resources for each resource type.

The data displayed is dependent on the settings of the configuration recorder for each account in the selected aggregator and the Regions where the selected aggregator is configured to collect data.

Top 10 accounts by noncompliant resources

Top 10 accounts by noncompliant resources displays a horizontal bar graph comparing up to 10 accounts from the selected aggregator in descending order by the number of noncompliant resources. Hover over the graph to see the exact number of noncompliant resources for each account.

The data displayed depends on the settings of the configuration recorder for each account in the selected aggregator, and the Regions where the selected aggregator is configured to collect data.

Top 10 regions by noncompliant resources

Displays a horizontal bar graph comparing up to 10 Regions where the selected aggregator collects data in descending order by the number of noncompliant resources. Hover over the graph to see the exact number of noncompliant resources for each Region.

The data displayed depends on the settings of the configuration recorder for each account in the selected aggregator.

Top 10 account level conformance packs by noncompliant rules

Displays a horizontal bar graph comparing up to 10 account level conformance packs from the selected aggregator in descending order by the number of noncompliant rules. Hover over

the graph to see the percentage of compliant and noncompliant rules for each account level conformance pack.

The data displayed depends on the settings of the configuration recorder for each account in the selected aggregator, and the Regions where the selected aggregator is configured to collect data.

Top 10 organization level conformance packs by noncompliant rules

Displays a horizontal bar graph comparing up to 10 organizational level conformance packs from the selected aggregator in descending order by the number of noncompliant rules. Hover over the graph to see the percentage of compliant and noncompliant rules in each organizational level conformance pack.

The data displayed is dependent on the settings of the configuration recorder for each account in the selected aggregator and the Regions where the selected aggregator is configured to collect data.

Top 10 accounts by noncompliant rules across conformance packs

Top 10 accounts by noncompliant rules across conformance packs displays a horizontal bar graph comparing up to 10 accounts from the selected aggregator in descending order by the number of noncompliant rules across all your conformance packs. Hover over the graph to see the exact number of noncompliant rules in each account.

The data displayed is dependent on the settings of the configuration recorder for each account in the selected aggregator and the Regions where the selected aggregator is configured to collect data.

Inventory Dashboard

View automated inventory dashboards by using widgets that summarize insights about resource configuration data within your aggregator.

Top 10 resource types by resource count

Displays a horizontal bar graph comparing up to 10 resource types from the selected aggregator in descending order by resource count. Hover over the graph to see the exact number of resources for each resource type.

The data displayed depends on the settings of the configuration recorder for each account in the selected aggregator, and the Regions where the selected aggregator is configured to collect data.

Resource count by region

Displays a horizontal bar graph comparing up to 10 Regions where the selected aggregator collects data in descending order by resource count. Hover over the graph to see the exact number of resources for each Region.

The data displayed depends on the settings of the configuration recorder for each account in the selected aggregator.

Top 10 accounts by resource count

Displays a horizontal bar graph comparing up to 10 accounts from the selected aggregator in descending order by resource count. Hover over the graph to see the exact number resources for each resource type.

The data displayed is dependent on the settings of the configuration recorder for each account in the selected aggregator and the Regions where the selected aggregator is configured to collect data.

Resource count by Amazon EC2 service resource types

Displays a horizontal bar graph comparing Amazon EC2 resource types from the selected aggregator in descending order by resource count. Hover over the graph to see the exact number of resources for each Amazon EC2 resource type.

The data displayed depends on the settings of the configuration recorder for each account in the selected aggregator, and the Regions where the selected aggregator is configured to collect data. To use this chart, you must configure the recorder to record Amazon EC2 resource types. For more information, see Selecting Which Resources AWS Config Records.

Top 10 EC2 instance types used

Displays a horizontal bar graph comparing up to 10 Amazon EC2 instance types from the selected aggregator in descending order by usage. Hover over the graph to see usage for each EC2 instance type.

The data displayed depends on the settings of the configuration recorder for each account in the selected aggregator and the Regions where the selected aggregator is configured to collect

data. To use this chart, you must configure the recorder to record the EC2 instance resource type. For more information, see Recoding AWS Resources.

EBS Volume counts by volume type and size

Displays a vertical bar graph comparing EBS volumes from the selected aggregator by resource count. Hover over the graph to see the count and size breakdown for each type of EBS volume.

The data displayed depends on the settings of the configuration recorder for each account in the selected aggregator and the Regions where the selected aggregator is configured to collect data. To use this chart, you must configure the recorder to record the EC2 volume resource type. For more information, see Selecting Which Resources AWS Config Records.

Number of EC2 instances that are running vs. stopped by type

Displays a horizontal bar graph comparing EC2 instance types from the selected aggregator that are running to EC2 instances that are stopped by instance type. Hover over the graph to see the exact number of stopped and running EC2 instances for each type.

The data displayed depends on the settings of the configuration recorder for each account in the selected aggregator and the Regions where the selected aggregator is configured to collect data. To use this chart, you must configure the recorder to record the EC2 instance resource type. For more information, see Recoding AWS Resources.

Creating Aggregators for AWS Config

You can use the AWS Config console or the AWS CLI to create your aggregators. From the AWS Config you can choose **Add individual account IDs** or **Add my organization** from where you want to aggregate data. For the AWS CLI there are two different procedures.

Creating Aggregators (Console)

On the **Aggregator** page, you can create an aggregator by specifying the source account IDs or organization and regions from where you want to aggregate data.

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Navigate to the **Aggregators** page and choose **Create aggregator**.
3. **Allow data replication**, gives permission to AWS Config to replicate data from the source accounts into an aggregator account.

Choose **Allow AWS Config to replicate data from source account(s) into an aggregator account. You must select this checkbox to continue to add an aggregator**.

4. For **Aggregator name**, type the name for your aggregator.

   The aggregator name must be a unique name with a maximum of 64 alphanumeric characters. The name can contain hyphens and underscores.

5. For **Select source accounts**, either choose **Add individual account IDs** or **Add my organization** from where you want to aggregate data.

   > **Note**
   >
   > Authorization is required when using **Add individual account IDs** to select source accounts.

   - If you choose **Add individual account IDs**, you can add individual account IDs for an aggregator account.
     1. Choose **Add source accounts** to add account IDs.
     2. Choose **Add AWS account IDs** to manually add comma-separated AWS account IDs. If you want to aggregate data from the current account, type the account ID of the account.

        OR

        Choose **Upload a file** to upload a file (.txt or .csv) of comma-separated AWS account IDs.
     3. Choose **Add source accounts** to confirm your selection.
   - If you choose **Add my organization**, you can add all accounts in your organization to an aggregator account.

     > **Note**
     >
     > You must be signed in to the management account or a registered delegated administrator and all the features must be enabled in your organization. If the caller is a management account, AWS Config calls `EnableAwsServiceAccess` API to enable integration between AWS Config and AWS Organizations.

If the caller is a registered delegated administrator, AWS Config calls `ListDelegatedAdministrators` API to verify whether the caller is a valid delegated administrator.
Ensure that the management account registers delegated administrator for AWS Config service principal name (config.amazonaws.com) before the delegated administrator creates an aggregator. To register a delegated administrator, see Registering a Delegated Administrator for AWS Config.

You must assign an IAM role to allow AWS Config to call read-only APIs for your organization.

1. Choose **Choose a role from your account** to select an existing IAM role.

> **Note**
>
> In the IAM console, attach the `AWSConfigRoleForOrganizations` managed policy to your IAM role. Attaching this policy allows AWS Config to call AWS Organizations `DescribeOrganization`, `ListAWSServiceAccessForOrganization`, and `ListAccounts` APIs. By default `config.amazonaws.com` is automatically specified as a trusted entity.

2. Or, choose **Create a role** and type a name for your IAM role name to create IAM role.

6. For **Regions**, choose the regions for which you want to aggregate data.
   - Select one region or multiple regions or all the AWS Regions.
   - Select **Include future AWS Regions** to aggregate data from all future AWS Regions where multi-account multi-region data aggregation is enabled.
7. Choose **Save**. AWS Config displays the aggregator.

Creating Aggregators using Individual Accounts (AWS CLI)

1. Open a command prompt or a terminal window.
2. Enter the following command to create an aggregator named **`MyAggregator`**.

```
aws configservice put-configuration-aggregator --configuration-aggregator-name
 MyAggregator --account-aggregation-sources "[{\"AccountIds\": [\"AccountID1\",
\"AccountID2\",\"AccountID3\"],\"AllAwsRegions\": true}]"
```

For `account-aggregation-sources`, enter one of the following.

- A comma-separated list of AWS account IDs for which you want to aggregate data. Wrap the account IDs in square brackets, and be sure to escape quotation marks (for example, `"[{\"AccountIds\": [\"AccountID1\",\"AccountID2\",\"AccountID3\"], \"AllAwsRegions\": true}]"`).
- You can also upload a JSON file of comma-separated AWS account IDs. Upload the file using the following syntax: `--account-aggregation-sources MyFilePath/MyFile.json`

  The JSON file must be in the following format:

```
[
    {
        "AccountIds": [
            "AccountID1",
            "AccountID2",
            "AccountID3"
        ],
        "AllAwsRegions": true
    }
]
```

3. Press Enter to execute the command.

   You should see output similar to the following:

```
{
    "ConfigurationAggregator": {
        "ConfigurationAggregatorArn": "arn:aws:config:Region:AccountID:config-
aggregator/config-aggregator-floqpus3",
        "CreationTime": 1517942461.442,
        "ConfigurationAggregatorName": "MyAggregator",
        "AccountAggregationSources": [
            {
```

```
                "AllAwsRegions": true,
                "AccountIds": [
                    "AccountID1",
                    "AccountID2",
                    "AccountID3"
                ]
            }
        ],
        "LastUpdatedTime": 1517942461.442
    }
}
```

Creating Aggregators using AWS Organizations (AWS CLI)

Before you begin this procedure, you must be signed in to the management account or a registered delegated administrator and all the features must be enabled in your organization.

> **Note**
>
> Ensure that the management account registers a delegated administrator with both of the following AWS Config service principal names (`config.amazonaws.com` and`config-multiaccountsetup.amazonaws.com`) before the delegated administrator creates an aggregator. To register a delegated administrator, see Registering a Delegated Administrator for AWS Config.

1. Open a command prompt or a terminal window.
2. If have not created an IAM role for your AWS Config aggregator, enter the following command:

```
aws iam create-role --role-name OrgConfigRole --assume-role-policy-document
 "{\"Version\":\"2012-10-17\",       \"Statement\":[{\"Sid\":\"\",\"Effect
\":\"Allow\",\"Principal\":{\"Service\":\"config.amazonaws.com\"},\"Action
\":\"sts:AssumeRole\"}]}" --description "Role for organizational AWS Config
 aggregator"
```

> **Note**
>
> Copy the Amazon Resource Name (ARN) from this IAM role for use when you create your AWS Config aggregator. You can find the ARN on the response object.

3. If have not attached a policy to your IAM role, attach the AWSConfigRoleForOrganizations managed policy or enter the following command:

```
aws iam create-policy --policy-name OrgConfigPolicy --policy-document
 '{"Version":"2012-10-17",       "Statement":[{"Effect":"Allow","Action":
["organizations:ListAccounts","organizations:DescribeOrganization","organizations:ListAW
```

4. Enter the following command to create an aggregator named **`MyAggregator`**.

```
aws configservice put-configuration-aggregator --configuration-aggregator-name
 MyAggregator --organization-aggregation-source "{\"RoleArn\": \"Complete-Arn\",
\"AllAwsRegions\": true}"
```

5. Press Enter to execute the command.

   You should see output similar to the following:

```
{
    "ConfigurationAggregator": {
        "ConfigurationAggregatorArn": "arn:aws:config:Region:AccountID:config-
aggregator/config-aggregator-floqpus3",
        "CreationTime": 1517942461.442,
        "ConfigurationAggregatorName": "MyAggregator",
        "OrganizationAggregationSource": {
                "AllAwsRegions": true,
                "RoleArn": "arn:aws:iam::account-of-role-to-assume:role/name-of-
role"
         },
        "LastUpdatedTime": 1517942461.442
    }
}
```

Registering a Delegated Administrator for AWS Config

Delegated administrators are accounts within a given AWS Organization that are granted additional administrative privileges for a specified AWS service. For more information, see Delegated administrator in the *AWS Organizations User Guide*. You must use the AWS CLI to register a delegated administrator.

Registering a Delegated Administrator

1. Log in with management account credentials.
2. Open a command prompt or a terminal window.
3. Enter the following command to enable service access as a delegated administrator for your organization to deploy and manage AWS Config rules and conformance packs across your organization:

```
aws organizations enable-aws-service-access --service-principal=config-
multiaccountsetup.amazonaws.com
```

4. Enter the following command to enable service access as a delegated administrator for your organization to aggregate AWS Config data across your organization:

```
aws organizations enable-aws-service-access --service-
principal=config.amazonaws.com
```

5. To check if the enable service access is complete, enter the following command and press Enter to execute the command.

```
aws organizations list-aws-service-access-for-organization
```

You should see output similar to the following:

```
{
    "EnabledServicePrincipals": [
        {
            "ServicePrincipal": [
                "config.amazonaws.com",
                "config-multiaccountsetup.amazonaws.com"
        ],
            "DateEnabled": 1607020860.881
        }
```

```
    ]
}
```

6. Next, enter the following command to register a member account as a delegated administrator for AWS Config.

```
aws organizations register-delegated-administrator --service-principal=config-
multiaccountsetup.amazonaws.com --account-id MemberAccountID
```

and

```
aws organizations register-delegated-administrator --service-
principal=config.amazonaws.com --account-id MemberAccountID
```

7. To check if the registration of delegated administrator is complete, enter the following command from the management account and press Enter to execute the command.

```
aws organizations list-delegated-administrators --service-principal=config-
multiaccountsetup.amazonaws.com
```

and

```
aws organizations list-delegated-administrators --service-
principal=config.amazonaws.com
```

You should see output similar to the following:

```
{
    "DelegatedAdministrators": [
        {
            "Id": "MemberAccountID",
            "Arn": "arn:aws:organizations::ManagementAccountID:account/o-
c7esubdi38/MemberAccountID",
            "Email": "name@amazon.com",
            "Name": "name",
            "Status": "ACTIVE",
            "JoinedMethod": "INVITED",
            "JoinedTimestamp": 1604867734.48,
            "DelegationEnabledDate": 1607020986.801
        }
    ]
```

```
}
```

Editing Aggregators for AWS Config

You can use the AWS Config console or the AWS CLI to edit your aggregators.

Editing Aggregators (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Navigate to the **Aggregator** page, and choose the aggregator name.
3. Choose **Actions** and then choose **Edit**.
4. Use the sections on the **Edit aggregator** page to change the source accounts, IAM roles, or regions for the aggregator.

   > **Note**
   >
   > You cannot change source type from individual account(s) to organization and vice versa.

5. Choose **Save**.

Editing Aggregators (AWS CLI)

1. You can use the `put-configuration-aggregator` command to update or edit a configuration aggregator.

   Enter the following command to add a new account ID to **`MyAggregator`**:

   ```
   aws configservice put-configuration-aggregator --configuration-aggregator-name
    MyAggregator --account-aggregation-sources "[{\"AccountIds\": [\"AccountID1\",
   \"AccountID2\",\"AccountID3\"],\"AllAwsRegions\": true}]"
   ```

2. Depending on your source account you should see output similar to the following:

   For individuals accounts

   ```
   {
   ```

```
    "ConfigurationAggregator": {
        "ConfigurationAggregatorArn": "arn:aws:config:Region:AccountID:config-
aggregator/config-aggregator-xz2upuu6",
        "CreationTime": 1517952090.769,
        "ConfigurationAggregatorName": "MyAggregator",
        "AccountAggregationSources": [
            {
                "AllAwsRegions": true,
                "AccountIds": [
                    "AccountID1",
                    "AccountID2",
                    "AccountID3",
                    "AccountID4"
                ]
            }
        ],
        "LastUpdatedTime": 1517952566.445
    }
}
```

OR

For an organization

```
{
    "ConfigurationAggregator": {
        "ConfigurationAggregatorArn": "arn:aws:config:Region:AccountID:config-
aggregator/config-aggregator-floqpus3",
        "CreationTime": 1517942461.442,
        "ConfigurationAggregatorName": "MyAggregator",
        "OrganizationAggregationSource": {
                "AllAwsRegions": true,
                "RoleArn": "arn:aws:iam::account-of-role-to-assume:role/name-of-
role"
         },
        "LastUpdatedTime": 1517942461.442
    }
}
```

Deleting Aggregators for AWS Config

You can use the AWS Config console or the AWS CLI to delete your aggregators.

Deleting Aggregators (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Navigate to the **Aggregator** page, and choose the aggregator name.
3. Choose **Actions** and then choose **Delete**.

   A warning message is displayed. Deleting an aggregator results in the loss of all aggregated data. You cannot recover this data but data in the source account(s) is not impacted.
4. Choose **Delete** to confirm your selection.

Deleting Aggregators (AWS CLI)

Enter the following command:

```
aws configservice delete-configuration-aggregator --configuration-aggregator-name
 MyAggregator
```

If successful, the command executes with no additional output.

Authorizing Aggregator Accounts to Collect AWS Config Configuration and Compliance Data

Authorization refers to the permissions you grant to an aggregator account and region to collect your AWS Config configuration and compliance data. Authorization is not required if you are aggregating source accounts that are part of AWS Organizations. You can use the AWS Config console or the AWS CLI to authorize aggregator accounts.

Topics

- Considerations
- Adding Authorization

Considerations

There are two types of aggregators: Individual account aggregator and Organization aggregator

For an individual account aggregator, authorization is required for all source accounts and Regions that you want to include, including both external accounts and Regions and Organization member accounts and Regions.

For an organization aggregator, authorization is not required for Organization member account regions since authorization is integrated with the AWS Organizations service.

Aggregators do not automatically enable AWS Config on your behalf

AWS Config needs to be enabled in the source account and Region for either type of aggregator, in order for AWS Config data to be generated in the source account and Region.

Adding Authorization

Adding Authorization (Console)

You can add authorization to grant permission to aggregator accounts and Regions to collect AWS Config configuration and compliance data.

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Navigate to the **Authorizations** page and choose **Add authorization**.
3. For **Aggregator account**, type the 12-digit account ID of an aggregator account.
4. For **Aggregator region**, choose the AWS Regions where the aggregator account is allowed to collect AWS Config configuration and compliance data.
5. Choose **Add authorization** to confirm your selection.

   AWS Config displays an aggregator account, Region, and authorization status.

   > **Note**
   >
   > You can also add authorizations to aggregator accounts and Regions programatically using CloudFormation sample templates. For more information, see AWS::Config::AggregationAuthorization in the *CloudFormation User Guide*.

Authorizing a Pending Request (Console)

If you have a pending authorization request from an existing aggregator account you will see the request status on the **Authorizations** page. You can authorize a pending request from this page.

1. Choose the aggregator account that you want to authorize, and then choose **Authorize**.

   A confirmation message is displayed to confirm that you want to grant the aggregator account permission to collect AWS Config data from this account.
2. Choose **Authorize** again to confirm that you want to grant permission to the aggregator account.

   The authorization status changes from **Requesting for authorization** to **Authorized**.

Authorization approval period

Authorization approval is required to add source accounts to an individual account aggregator. A pending authorization approval request will be available for 7 days after an individual account aggregator adds a source account.

Adding Authorization (AWS CLI)

1. Open a command prompt or a terminal window.
2. Enter the following command:

```
aws configservice put-aggregation-authorization --authorized-account-id
  AccountID --authorized-aws-region Region
```

3. You should see output similar to the following:

```
{
    "AggregationAuthorization": {
        "AuthorizedAccountId": "AccountID",
        "AggregationAuthorizationArn":
 "arn:aws:config:Region:AccountID:aggregation-authorization/AccountID/Region",
        "CreationTime": 1518116709.993,
        "AuthorizedAwsRegion": "Region"
    }
}
```

Deleting Authorization for Aggregator Accounts to Collect AWS Config Configuration and Compliance Data

Authorization refers to the permissions you grant to an aggregator account and region to collect your AWS Config configuration and compliance data. Authorization is not required if you are aggregating source accounts that are part of AWS Organizations. You can use the AWS Config console or the AWS CLI to delete authorizations.

Topics

- Considerations
- Deleting Authorization

Considerations

There are two types of aggregators: Individual account aggregator and Organization aggregator

For an individual account aggregator, authorization is required for all source accounts and Regions that you want to include, including both external accounts and Regions and Organization member accounts and Regions.

For an organization aggregator, authorization is not required for Organization member account regions since authorization is integrated with the AWS Organizations service.

Aggregators do not automatically enable AWS Config on your behalf

AWS Config needs to be enabled in the source account and Region for either type of aggregator, in order for AWS Config data to be generated in the source account and Region.

Deleting Authorization

Deleting Authorization (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose the aggregator account that you want to delete authorization, and then choose **Delete**.

A warning message is displayed. When you delete this authorization, AWS Config data will no longer be shared with the aggregator account.

3. Choose **Delete** again to confirm your selection.

   The aggregator account is now deleted.

Deleting Authorization (AWS CLI)

Enter the following command:

```
aws configservice delete-aggregation-authorization --authorized-account-id
  AccountID --authorized-aws-region Region
```

If successful, the command executes with no additional output.

Viewing Aggregators for AWS Config

You can use the AWS Config console or the AWS CLI to view your aggregators.

Viewing Aggregators (Console)

To view your conformance packs in the AWS Management Console, see Aggregator Dashboard.

Viewing Aggregators (AWS CLI)

1. Enter the following command:

   ```
   aws configservice describe-configuration-aggregators
   ```

2. Depending on your source account you should see output similar to the following:

   For individuals accounts

   ```
   {
       "ConfigurationAggregators": [
           {
               "ConfigurationAggregatorArn":
    "arn:aws:config:Region:AccountID:config-aggregator/config-aggregator-floqpus3",
               "CreationTime": 1517942461.442,
   ```

```
            "ConfigurationAggregatorName": "MyAggregator",
            "AccountAggregationSources": [
                {
                    "AllAwsRegions": true,
                    "AccountIds": [
                        "AccountID1",
                        "AccountID2",
                        "AccountID3"
                    ]
                }
            ],
            "LastUpdatedTime": 1517942461.455
        }
    ]
}
```

OR

For an organization

```
{
    "ConfigurationAggregator": {
        "ConfigurationAggregatorArn": "arn:aws:config:Region:AccountID:config-
aggregator/config-aggregator-floqpus3",
        "CreationTime": 1517942461.442,
        "ConfigurationAggregatorName": "MyAggregator",
        "OrganizationAggregationSource": {
                "AllAwsRegions": true,
                "RoleArn": "arn:aws:iam::account-of-role-to-assume:role/name-of-
role"
         },
        "LastUpdatedTime": 1517942461.442
    }
}
```

Troubleshooting for Multi-Account Multi-Region Data Aggregation for AWS Config

AWS Config might not aggregate data from source accounts for one of the following reasons:

If this happens	Do this
AWS Config is not enabled in the source account for accounts within an Organization.	Enable AWS Config in the source account and authorize the aggregator account to collect data.
Authorization is not granted to an aggregator account.	Sign in to the source account and grant authorization to the aggregator account to collect AWS Config data.
There might be a temporary issue that is preventing data aggregation.	Data aggregation is subject to delays. Wait for a few minutes.

AWS Config might not aggregate data from an organization for one of the following reasons:

If this happens	Do this
AWS Config is unable to access your organization details due to invalid IAM role.	Create an IAM role or select a valid IAM role from the IAM role list. **Note** If the IAM role is invalid for more than 7 days, AWS Config deletes data for entire organizat ion.
AWS Config service access is disabled in your organization.	You can enable integration between AWS Config and AWS Organizations through the `EnableAWS ServiceAccess` API. If you choose **Add my organization** in console, AWS Config automatically enables the integration between AWS Config and AWS Organizations.
AWS Config is unable to access your organization details because all features is not enabled in your organization.	Enable all features in AWS Organizations console.

If this happens	Do this
Organizational changes such as adding an account, removing an account, enabling service access, and disabling service access are not updated in Middle East (Bahrain) and Asia Pacific (Hong Kong) regions immediately.	Organizational changes are subject to 2 hour delay. Wait for 2 hours to see all organization changes.

Querying the Current Configuration State of AWS Resources with AWS Config

You can use AWS Config to query the current configuration state of AWS resources based on configuration properties for a single account and Region or across multiple accounts and Regions. You can perform property-based queries against current AWS resource state metadata across a list of resources that AWS Config supports. For more information on the list of supported resource types, see Supported Resource Types.

Advanced queries provides a single query endpoint and a query language to get current resource state metadata without performing service-specific describe API calls. You can use configuration aggregators to run the same queries from a central account across multiple accounts and AWS Regions.

Topics

- Features
- Query Components for AWS Config
- Query Using the SQL Query Editor for AWS Config (Console)
- Query Using the SQL Query Editor for AWS Config (AWS CLI)
- Example Queries for AWS Config
- Example Relationship Queries for AWS Config
- Limitations
- CIDR notation/IP range behavior for advanced queries
- Multiple properties within an array behavior for advanced queries
- Supported Resource Types
- Region Support

Features

AWS Config uses a subset of structured query language (SQL) `SELECT` syntax to perform property-based queries and aggregations on the current configuration item (CI) data. The queries range in complexity from matches against tag and/or resource identifiers, to more complex queries, such as

viewing all Amazon S3 buckets that have versioning disabled. This allows you to query exactly the current resource state you need without performing AWS service-specific API calls.

It supports aggregation functions such as `AVG`, `COUNT`, `MAX`, `MIN`, and `SUM`.

You can use advanced query for:

- Inventory management; for example, to retrieve a list of Amazon EC2 instances of a particular size.
- Security and operational intelligence; for example, to retrieve a list of resources that have a specific configuration property enabled or disabled.
- Cost optimization; for example, to identify a list of Amazon EBS volumes that are not attached to any EC2 instance.
- Compliance data; for example, to retrieve a list of all your conformance packs and their compliance status.

For information about how to use the AWS SQL Query Language, see [What Is SQL (Structured Query Language)?](#).

Query Components for AWS Config

The SQL `SELECT` query components for AWS Config advanced queries are as follows.

Synopsis

```
SELECT property [, ...]
[ WHERE condition ]
[ GROUP BY property ]
[ ORDER BY property [ ASC | DESC ] [, property [ ASC | DESC ] ...] ]
```

Parameters

[WHERE condition]

Filters results according to the `condition` you specify.

Comparison operators

- = (equals)
- `IN` (list membership)
- `BETWEEN` (range check)

Logic operators

- `AND`
- `OR`
- `NOT`

[GROUP BY property]

Aggregates the result set into groups of rows with matching values for the given property.

The GROUP BY clause is applicable to aggregations.

[ORDER BY property [ASC | DESC] [, property [ASC | DESC] ...]]

Sorts a result set by one or more output `properties`.

When the clause contains multiple properties, the result set is sorted according to the first `property`, then according to the second `property` for rows that have matching values for the first property, and so on.

Examples

```
SELECT resourceId WHERE resourceType='AWS::EC2::Instance'
```

```
SELECT configuration.complianceType, COUNT(*) WHERE resourceType =
 'AWS::Config::ResourceCompliance' GROUP BY configuration.complianceType
```

Query Using the SQL Query Editor for AWS Config (Console)

You can either use AWS sample queries or you can create your own query called as custom queries.

Considerations

Prerequisites

If you are using the one of the following AWS managed policies, you will have the necessary permissions to run and save a query: AWSServiceRoleForConfig (service-linked role) or AWS_ConfigRole.

Otherwise, you must have the permissions included in the AWSConfigUserAccess AWS managed policy.

List of properties that you can query

An updated list of properties and their data types is available in GitHub.

Advanced queries and aggregators

To run a query on an aggregator, create an aggregator. For more information, see Creating Aggregators for AWS Config.

If you already have an aggregator set up, in the query scope, choose the aggregator to run an advanced query on that aggregator. When you select an aggregator, consider adding the AWS account ID and AWS Region in the query statement to view that information in the results.

Use an AWS Sample Query

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Advanced queries** from the left navigation to query your resource configurations for a single account and Region or for multiple accounts and Regions.
3. On the **Advanced queries** page, choose an appropriate query from the list of queries. You can filter through the list of queries either by the name, description, creator, or tags. To filter for AWS queries, choose **Creator**, and enter **AWS**. The query that you select is displayed in the SQL query editor. You can edit the selected query to fit your needs.
4. To save this query to a new query, choose **Save As**.
   - In the **Query Name** field, update the name of the query.
   - In the **Description** field, update the description of the query.
   - Enter up to 50 unique tags for this query.
   - Choose **Save**.
5. Choose **Run**. The query results are displayed in the table below the query editor.
6. Choose **Export as** to export the query results in CSV or JSON format.

Create your custom query

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Advanced queries** from the left navigation to query your resource configurations for a single account and Region or for multiple accounts and Regions.
3. To create your custom query, choose **New query**.

   To view or edit a custom query, filter a query either by the name, description, creator or tags. To filter custom queries, choose **Creater** and enter **Custom**.
4. On the **Query editor** page, create your own query for this account and Region. You can also select an appropriate aggregator to create a query for multiple accounts and Regions.
5. Edit if you wish you make changes to this query. Choose **Save Query** to save this query.
   - In the **Query Name** field, update the name of the query.
   - In the **Description** field, update the description of the query.
   - Enter up to 50 unique tags for this query.
   - Choose **Save**.
6. Choose **Run**. The query results are displayed in the table below the query editor.
7. Choose **Export as** to export the query results in CSV or JSON format.

Query Using the SQL Query Editor for AWS Config (AWS CLI)

The AWS CLI is a unified tool to manage your AWS services. With just one tool to download and configure, you can control multiple AWS services from the command line and use scripts to automate them. For more information about the AWS CLI and for instructions on installing the AWS CLI tools, see the following in the *AWS Command Line Interface User Guide*.

- AWS Command Line Interface User Guide
- Getting Set Up with the AWS Command Line Interface

If necessary, enter `aws configure` to configure the AWS CLI to use an AWS Region where advanced queries are available.

Considerations

Prerequisites

If you are using the one of the following AWS managed policies, you will have the necessary permissions to run and save a query: AWSServiceRoleForConfig (service-linked role) or AWS_ConfigRole.

Otherwise, you must have the permissions included in the AWSConfigUserAccess AWS managed policy.

List of properties that you can query

An updated list of properties and their data types is available in GitHub.

Advanced queries and aggregators

To run a query on an aggregator, create an aggregator. For more information, see Creating Aggregators for AWS Config.

If you already have an aggregator set up, in the query scope, choose the aggregator to run an advanced query on that aggregator. When you select an aggregator, consider adding the AWS account ID and AWS Region in the query statement to view that information in the results.

Query Resource Configuration Data

To query your resource configuration data using the query editor (AWS CLI) for a single account and Region

1. Open a command prompt or a terminal window.
2. Enter the following command to query your resource configuration data.

```
aws configservice select-resource-config --expression "SELECT resourceId WHERE
 resourceType='AWS::EC2::Instance'"
```

Depending on your query, the output looks like the following.

```
{
    "QueryInfo": {
        "SelectFields": [
            {
```

```
                "Name": "resourceId"
            }
        ]
    },
    "Results": [
        "{\"resourceId\":\"ResourceId\"}",
        "{\"resourceId\":\"ResourceId\"}",
        "{\"resourceId\":\"ResourceId\"}",
        "{\"resourceId\":\"ResourceId\"}",
        "{\"resourceId\":\"ResourceId\"}",
        "{\"resourceId\":\"ResourceId\"}",
        "{\"resourceId\":\"ResourceId\"}"
    ]
}
```

To query your resource configuration data using the query editor (AWS CLI) for multiple accounts and Regions

1. Open a command prompt or a terminal window.
2. Enter the following command to query your resource configuration data.

```
aws configservice select-aggregate-resource-config --expression "SELECT resourceId
 WHERE resourceType='AWS::EC2::Instance'" --configuration-aggregator-name my-
aggregator
```

Depending on your query, the output looks like the following.

```
{
    "QueryInfo": {
        "SelectFields": [
            {
                "Name": "resourceId"
            }
        ]
    },
    "Results": [
        "{\"resourceId\":\"ResourceId\"}",
        "{\"resourceId\":\"ResourceId\"}",
        "{\"resourceId\":\"ResourceId\"}",
        "{\"resourceId\":\"ResourceId\"}",
        "{\"resourceId\":\"ResourceId\"}",
```

```
        "{\"resourceId\":\"ResourceId\"}",
        "{\"resourceId\":\"ResourceId\"}"
    ]
}
```

> **Note**
>
> While using the `AWS::IAM::User`, `AWS::IAM::Group`, `AWS::IAM::Role`, and `AWS::IAM::Policy` resource types in an advanced query, use `awsRegion = 'global'`.

Save a Query

1. Open a command prompt or a terminal window.
2. Enter the following command to save a query.

```
aws configservice put-stored-query --stored-query "{\"QueryName\": \"cli-test\",
 \"Expression\": \"SELECT *\", \"Description\": \"cli test query\" }"
        --tags "[{ \"Key\": \"first-tag\", \"Value\": \"\" }, { \"Key\": \"second-
tag\", \"Value\": \"non-empty-tag-value\" }]"
```

3. Depending on your query, the output looks like the following.

```
{
    "QueryArn": "arn:aws:config:eu-central-1:Account ID:stored-query/cli-test/
query-e65mijt4rmam5pab"
}
```

> **Note**
>
> `--tags` is optional. When you pass the tags, the saved tags will not be returned by either `list-stored-queries` or `get-stored-query`. You must use `list-tag-for-resources` to retrieve the associated tags for a saved query.
> `--description` is optional while creating or updating a query.

View all the Saved Queries

1. Enter the following command to view the list of all saved queries.

```
aws configservice list-stored-queries
```

2. Depending on your query, the output looks like the following.

```
{
    "StoredQueryMetadata": [
        {
            "QueryId": "query-e65mijt4rmam5pab",
            "QueryArn": "arn:aws:config:eu-central-1:Account ID:stored-query/cli-
test/query-e65mijt4rmam5pab",
            "QueryName": "cli-test"
        },
        {
            "QueryId": "query-rltwlewlqfivadxq",
            "QueryArn": "arn:aws:config:eu-central-1:Account ID:stored-query/cli-
test-2/query-rltwlewlqfivadxq",
            "QueryName": "cli-test-2",
            "Description": "cli test query"
        }
    ]
}
}
```

Get Details of a Saved Query

1. Enter the following command to get details of a specific saved query.

```
aws configservice get-stored-query --query-name cli-test
```

2. Depending on your query, the output looks like the following.

```
{
    "StoredQuery": {
        "QueryId": "query-e65mijt4rmam5pab",
        "QueryArn": "arn:aws:config:eu-central-1:Account ID:stored-query/cli-test/
query-e65mijt4rmam5pab",
        "QueryName": "cli-test",
```

```
        "Description": "cli test query",
        "Expression": "SELECT *"
    }
}
```

Delete a Saved Query

- Enter the following command to delete your saved query.

```
aws configservice delete-stored-query --query-name cli-test
```

If successful, the command runs with no additional output.

Example Queries for AWS Config

View the following example queries.

Query to list all EC2 instances with AMI ID ami-12345

Query:

```
SELECT
    resourceId,
    resourceType,
    configuration.instanceType,
    configuration.placement.tenancy,
    configuration.imageId,
    availabilityZone
WHERE
    resourceType = 'AWS::EC2::Instance'
AND
    configuration.imageId = 'ami-12345'
```

Results:

```
{
    "QueryInfo": {
        "SelectFields": [
            {
                "Name": "resourceId"
```

```
            },
            {
                "Name": "resourceType"

    ]
}
```

Query for count of resources grouped by their AWS Config rules compliance status

Query:

```
SELECT
    configuration.complianceType,
    COUNT(*)
WHERE
    resourceType = 'AWS::Config::ResourceCompliance'
GROUP BY
    configuration.complianceType
```

Results:

```
{
    "QueryInfo": {
        "SelectFields": [
            {
                "Name": "configuration.complianceType"
            },
            {
                "Name": "COUNT(*)"
            }
        ]
    },
    "Results": [
        "{\"COUNT(*)\":163,\"configuration\":{\"complianceType\":\"NON_COMPLIANT
\"}}",
        "{\"COUNT(*)\":2,\"configuration\":{\"complianceType\":\"COMPLIANT\"}}"
    ]
}
```

Query for the compliance status of AWS Conformance packs

Query:

```
SELECT
    resourceId,
    resourceName,
    resourceType,
    configuration.complianceType
WHERE
    resourceType = 'AWS::Config::ConformancePackCompliance'
```

Results:

```
{
    "QueryInfo": {
        "SelectFields": [
            {
                "Name": "resourceId"
            },
            {
                "Name": "resourceName"
            },

            },
            {
```

```
                "Name": "configuration.availabilityZone"
            },
            {
                "Name": "configuration.state.value"
            }
        ]
    }
}
```

Example Relationship Queries for AWS Config

View the following example relationship queries.

Find EIPs related to an EC2 instance

```
SELECT
    resourceId
WHERE
    resourceType = 'AWS::EC2::EIP'
    AND relationships.resourceId = 'i-abcd1234'
```

Find EIPs related to an EC2 network interface

```
SELECT
    resourceId
WHERE
    resourceType = 'AWS::EC2::EIP'
    AND relationships.resourceId = 'eni-abcd1234'
```

Find EC2 instances and network interfaces related to a security group

```
SELECT
    resourceId
WHERE
    resourceType IN ('AWS::EC2::Instance', 'AWS::EC2::NetworkInterface')
    AND relationships.resourceId = 'sg-abcd1234'
```

OR

```
SELECT
```

```
    resourceId
WHERE
    resourceType = 'AWS::EC2::Instance'
    AND relationships.resourceId = 'sg-abcd1234'

SELECT
    resourceId
WHERE
    resourceType = 'AWS::EC2::NetworkInterface'
    AND relationships.resourceId = 'sg-abcd1234'
```

Find EC2 instances, network ACLs, network interfaces and route tables related to a subnet

```
SELECT
    resourceId
WHERE
    resourceType IN ('AWS::EC2::Instance', 'AWS::EC2::NetworkACL',
 'AWS::EC2::NetworkInterface', 'AWS::EC2::RouteTable')
    AND relationships.resourceId = 'subnet-abcd1234'
```

Find EC2 instances, internet gateways, network ACLs, network interfaces, route tables, subnets and security groups related to a VPC

```
SELECT
    resourceId
WHERE
    resourceType IN ('AWS::EC2::Instance', 'AWS::EC2::InternetGateway',
 'AWS::EC2::NetworkACL', 'AWS::EC2::NetworkInterface', 'AWS::EC2::RouteTable',
 'AWS::EC2::Subnet', 'AWS::EC2::SecurityGroup')
    AND relationships.resourceId = 'vpc-abcd1234'
```

Find EC2 route tables related to a VPN gateway

```
SELECT
    resourceId
WHERE
    resourceType = 'AWS::EC2::RouteTable'
    AND relationships.resourceId = 'vgw-abcd1234'
```

Limitations

> **Note**
>
> Advanced query does not support querying resources which have not been configured to be recorded by the configuration recorder. AWS Config creates Configuration Items (CIs) with `ResourceNotRecorded` in the `configurationItemStatus` when a resource has been discovered but is not configured to be recorded by the configuration recorder. While an aggregator will aggregate these CIs, advanced query does not support querying CIs with `ResourceNotRecorded`. Update your recorder settings to enable recording of the resource types that you want to query.

As a subset of SQL `SELECT`, the query syntax has following limitations:

- No support for `ALL`, `AS`, `DISTINCT`, `FROM`, `HAVING`, `JOIN`, and `UNION` keywords in a query. `NULL` value queries are not supported.
- No support for complex `CASE` statements for creating a priority field directly in the query.
- No support for querying on third-party resources. Third-party resources retrieved using advanced queries will have the configuration field set as `NULL`.
- No support for nested structures (such as tags) to be unpacked with SQL queries.
- No support for querying deleted resources. To discover deleted resources, see Looking Up Resources That Are Discovered by AWS Config.
- The `SELECT` all columns shorthand (that is `SELECT *`) selects only the top-level, scalar properties of a CI. The scalar properties returned are `accountId`, `awsRegion`, `arn`, `availabilityZone`, `configurationItemCaptureTime`, `resourceCreationTime`, `resourceId`, `resourceName`, `resourceType`, and `version`.
- Wildcard limitations:
  - Wildcards are supported only for property values and not for property keys (for example, `...WHERE someKey LIKE 'someValue%'` is supported but `...WHERE 'someKey%' LIKE 'someValue%'` is not supported).
  - Support for only suffix wildcards (for example, `...LIKE 'AWS::EC2::%'` and `...LIKE 'AWS::EC2::_'` is supported but `...LIKE '%::EC2::Instance'` and `...LIKE '_::EC2::Instance'`is not supported).

- Wildcard matches must be at least three characters long (for example, `...LIKE 'ab%'` and `...LIKE 'ab_'` is not allowed but `...LIKE 'abc%'` and `...LIKE 'abc_'` is allowed).

> **Note**
>
> The "_" (single underscore) is also treated as a wildcard.

- Aggregation limitations:
  - Aggregate functions can accept only a single argument or property.
  - Aggregate functions cannot take other functions as arguments.
  - `GROUP BY` with an `ORDER BY` clause referencing aggregate functions may contain only a single property.
  - For all other aggregations `GROUP BY` clauses may contain up to three properties.
  - Pagination is supported for all aggregate queries except when `ORDER BY` clause has an aggregate function. For example, `GROUP BY X, ORDER BY Y` does not work if `Y` is an aggregate function.
  - No support for `HAVING` clauses in aggregations.
- Mismatched identifier limitations:

  Mismatched identifiers are properties that have the same spelling but different cases (upper and lower case). Advanced query does not support processing queries that contain mismatched identifiers. For example:
  - Two properties that have the exact same spelling but with different casing (`configuration.dbclusterIdentifier` and `configuration.dBClusterIdentifier`).
  - Two properties where one property is a subset of the other, and they have different casing (`configuration.ipAddress` and `configuration.ipaddressPermissions`).

CIDR notation/IP range behavior for advanced queries

CIDR notation is converted to IP ranges for search.

This means that `"="` and `"BETWEEN"` search for any range that includes the provided IP, instead of for an exact one.

To search for an exact IP range, you need to add in additional conditions to exclude IPs outside of the range.

Example Searching for exact CIDR block 10.0.0.0/24

```
SELECT * WHERE resourceType = 'AWS::EC2::SecurityGroup'
  AND configuration.ipPermissions.ipRanges BETWEEN '10.0.0.0'
  AND '10.0.0.255'
  AND NOT configuration.ipPermissions.ipRanges < '10.0.0.0'
  AND NOT configuration.ipPermissions.ipRanges > '10.0.0.255'
```

Example Searching for exact IP address 192.168.0.2/32

```
SELECT * WHERE resourceType = 'AWS::EC2::SecurityGroup'
  AND configuration.ipPermissions.ipRanges = '192.168.0.2'
  AND NOT configuration.ipPermissions.ipRanges > '192.168.0.2'
  AND NOT configuration.ipPermissions.ipRanges < '192.168.0.2'
```

Multiple properties within an array behavior for advanced queries

When querying against multiple properties within an array of objects, matches are computed against *all the array elements*.

For example, for a resource R with rules A and B, the resource is compliant to rule A but noncompliant to rule B. The resource R is stored as:

```
{
    configRuleList: [
        {
            configRuleName: 'A', complianceType: 'compliant'
        },
        {
            configRuleName: 'B', complianceType: 'non_compliant'
        }
    ]
}
```

R will be returned by this query:

```
SELECT configuration WHERE configuration.configRuleList.complianceType =
 'non_compliant'
AND configuration.configRuleList.configRuleName = 'A'
```

The first condition `configuration.configRuleList.complianceType = 'non_compliant'` is applied to ALL elements in R.configRuleList, because R has a rule (rule B) with complianceType = 'non_compliant', the condition is evaluated as true.

The second condition `configuration.configRuleList.configRuleName` is applied to ALL elements in R.configRuleList, because R has a rule (rule A) with configRuleName = 'A', the condition is evaluated as true. As both conditions are true, R will be returned.

Supported Resource Types

Not all resource types that AWS Config supports are queryable in Advanced Query. Additionally, some fields in a configuration item are unsearchable. Unsearchable fields may be returned in results and used in the `SELECT` portion of the query, but cannot be used in other parts of the query, such as `WHERE`, `GROUP BY`, or `ORDER BY`.

For a full list of searchable fields and resource types, see Supported Resource Types for Advanced Queries.

Region Support

Advanced queries is supported in the following Regions:

Region Name	Region	Endpoint	Protocol
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com	HTTPS
US West (N.	us-west-1	config.us-west-1.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
California)			
US West (Oregon)	us-west-2	config.us-west-2.amazonaws.com	HTTPS
Africa (Cape Town)	af-south-1	config.af-south-1.amazonaws.com	HTTPS
Asia Pacific (Hong Kong)	ap-east-1	config.ap-east-1.amazonaws.com	HTTPS
Asia Pacific (Hyderabad)	ap-south-2	config.ap-south-2.amazonaws.com	HTTPS
Asia Pacific (Jakarta)	ap-southeast-3	config.ap-southeast-3.amazonaws.com	HTTPS
Asia Pacific (Malaysia)	ap-southeast-5	config.ap-southeast-5.amazonaws.com	HTTPS
Asia Pacific (Melbourne)	ap-southeast-4	config.ap-southeast-4.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol	
Asia Pacific (Mumbai)	ap-south-1	config.ap-south-1.amazonaws.com	HTTPS	
Asia Pacific (New Zealand)	ap-southeast-6	config.ap-southeast-6.amazonaws.com	HTTPS	
Asia Pacific (Osaka)	ap-northeast-3	config.ap-northeast-3.amazonaws.com	HTTPS	
Asia Pacific (Seoul)	ap-northeast-2	config.ap-northeast-2.amazonaws.com	HTTPS	
Asia Pacific (Singapore)	ap-southeast-1	config.ap-southeast-1.amazonaws.com	HTTPS	
Asia Pacific (Sydney)	ap-southeast-2	config.ap-southeast-2.amazonaws.com	HTTPS	
Asia Pacific (Taipei)	ap-east-2	config.ap-east-2.amazonaws.com	HTTPS	
Asia Pacific (Thailand)	ap-southeast-7	config.ap-southeast-7.amazonaws.com	HTTPS	

Region Name	Region	Endpoint	Protocol	
Asia Pacific (Tokyo)	ap-northeast-1	config.ap-northeast-1.amazonaws.com	HTTPS	
Canada (Central)	ca-central-1	config.ca-central-1.amazonaws.com	HTTPS	
Canada West (Calgary)	ca-west-1	config.ca-west-1.amazonaws.com	HTTPS	
Europe (Frankfurt)	eu-central-1	config.eu-central-1.amazonaws.com	HTTPS	
Europe (Ireland)	eu-west-1	config.eu-west-1.amazonaws.com	HTTPS	
Europe (London)	eu-west-2	config.eu-west-2.amazonaws.com	HTTPS	
Europe (Milan)	eu-south-1	config.eu-south-1.amazonaws.com	HTTPS	
Europe (Paris)	eu-west-3	config.eu-west-3.amazonaws.com	HTTPS	
Europe (Spain)	eu-south-2	config.eu-south-2.amazonaws.com	HTTPS	
Europe (Stockholm)	eu-north-1	config.eu-north-1.amazonaws.com	HTTPS	
Europe (Zurich)	eu-central-2	config.eu-central-2.amazonaws.com	HTTPS	

Region Name	Region	Endpoint	Protocol
Israel (Tel Aviv)	il-central-1	config.il-central-1.amazonaws.com	HTTPS
Mexico (Central)	mx-central-1	config.mx-central-1.amazonaws.com	HTTPS
Middle East (Bahrain)	me-south-1	config.me-south-1.amazonaws.com	HTTPS
Middle East (UAE)	me-central-1	config.me-central-1.amazonaws.com	HTTPS
South America (São Paulo)	sa-east-1	config.sa-east-1.amazonaws.com	HTTPS
AWS GovCloud (US-East)	us-gov-east-1	config.us-gov-east-1.amazonaws.com	HTTPS
AWS GovCloud (US-West)	us-gov-west-1	config.us-gov-west-1.amazonaws.com	HTTPS

Deleting AWS Config Data

> **Note**
>
> While AWS Config uses Amazon Simple Storage Service (Amazon S3) and Amazon Simple Notification Service (Amazon SNS) for sending configuration snapshots and configuration history files, AWS Config has its own data store and retention policies. The information on this page is specific for AWS Config. Amazon S3 and Amazon SNS have their own separate data store and retention policies.

AWS Config allows you to delete your data by specifying a retention period for your `ConfigurationItems`. When you specify a retention period, AWS Config retains your `ConfigurationItems` for that specified period. You can choose a period between a minimum of 30 days and a maximum of 7 years (2557 days). AWS Config deletes data older than your specified retention period. If you do not specify a retention period, AWS Config continues to store `ConfigurationItems` for the default period of 7 years (2557 days). When recording is switched on, the current state of the resource is when a `ConfigurationItem` is recorded and until the next change (a new `ConfigurationItem`) is recorded.

To understand the behavior of retention period, let's take a look at the timeline.

- When recording is switched on, the current state of a resource always exists and can't be deleted irrespective of the date the `ConfigurationItem` is recorded.
- When AWS Config records new `ConfigurationItems`, the previous `ConfigurationItems` are deleted depending on the specified retention period.

In the following timeline, AWS Config records `ConfigurationItems` at the following dates. For the purpose of this timeline, today is represented as May 24, 2018.

The following table explains which `ConfigurationItems` are displayed on the AWS Config timeline based on selected retention period.

Retention Period	Configuration Items displayed on timeline	Explanation
30 days	December 12, 2017	The current state of the resource started from December 12, 2017 when the `ConfigurationItem` was recorded and is valid until today (May 24, 2018). When recording is turned on, the current state always exists.
365 days	December 12, 2017; November 12, 2017, and March 10, 2017	The retention period shows the current state December 12, 2017 and previous `ConfigurationItems` November 12, 2017 and March 10, 2017.

Retention Period	Configuration Items displayed on timeline	Explanation
		The `ConfigurationItem` for March 10, 2017 is displayed on the timeline because that configuration state represented the current state 365 days ago.

After you specify a retention period, AWS Config APIs no longer return `ConfigurationItems` that represent a state older than the specified retention period.

> **Note**
>
> - AWS Config cannot record your `ConfigurationItems` if recording is switched off.
> - AWS Config cannot record your `ConfigurationItems` if your IAM role has insufficient permissions. For more information, see Permissions for the IAM Role Assigned to AWS Config.

Setting Data Retention Period in AWS Management Console

In the AWS Management Console, if you do not select a data retention period, the default period is 7 years or 2557 days.

To set a custom data retention period for configuration items select the checkbox. You can select 1 year, 3 years, 5 years, or a custom period. For a custom period, enter the number of days between 30 and 2557 days.

The following image displays where you can set the data retention period in **Data Governance**. You can access **Data Governance** on the **Edit Settings** page from the AWS Config console by choosing **Settings** in the left navigation bar, and then choosing **Edit**.

Data governance
Data retention period
Retain AWS Config data for 7 years (2557 days)
Set a custom retention period for configuration items recorded by AWS Config.
IAM role for AWS Config
Use an existing AWS Config service-linked role
Service-linked roles are predefined and include all the permissions that AWS Config requires to call other AWS services.
Choose a role from your account
Choose an IAM role from one of your pre-existing roles and permission policies.

Security in AWS Config

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from data centers and network architectures that are built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS Compliance Programs. To learn about the compliance programs that apply to AWS Config, see AWS services in Scope by Compliance Program.
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using AWS Config. The following topics show you how to configure AWS Config to meet your security and compliance objectives.

Topics

- Data Protection in AWS Config
- Identity and Access Management for AWS Config
- Incident Response in AWS Config
- Compliance Validation for AWS Config
- Resilience in AWS Config
- Infrastructure Security in AWS Config
- Cross-service confused deputy prevention
- Security Best Practices for AWS Config

Data Protection in AWS Config

The AWS shared responsibility model applies to data protection in . As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see Data Privacy FAQ. For information about data protection in Europe, see the General Data Protection Regulation (GDPR) Center.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail. For information about using CloudTrail trails to capture AWS activities, see Working with CloudTrail trails in the *AWS CloudTrail User Guide*.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-3 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-3.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Encryption of Data at Rest

Data is encrypted at rest using transparent server-side encryption. This helps reduce the operational burden and complexity involved in protecting sensitive data. With encryption at rest,

you can build security-sensitive applications that meet encryption compliance and regulatory requirements.

Encryption of Data in Transit

Data gathered and accessed by AWS Config is exclusively over a Transport Layer Security (TLS) protected channel.

Identity and Access Management for AWS Config

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use AWS Config resources. IAM is an AWS service that you can use with no additional charge.

Topics

- Audience
- Authenticating with identities
- Managing access using policies
- How AWS Config works with IAM
- Identity-based policy examples for AWS Config
- AWS managed policies for AWS Config
- Permissions for the IAM Role Assigned to AWS Config
- Updating the IAM Role for the customer managed configuration recorder
- Permissions for the Amazon S3 Bucket for the AWS Config Delivery Channel
- Permissions for the KMS Key for the AWS Config Delivery Channel
- Permissions for the Amazon SNS Topic
- Troubleshooting AWS Config identity and access
- Using Service-Linked Roles for AWS Config

Audience

How you use AWS Identity and Access Management (IAM) differs based on your role:

- **Service user** - request permissions from your administrator if you cannot access features (see Troubleshooting AWS Config identity and access)
- **Service administrator** - determine user access and submit permission requests (see How AWS Config works with IAM)
- **IAM administrator** - write policies to manage access (see Identity-based policy examples for AWS Config)

Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. You must be authenticated as the AWS account root user, an IAM user, or by assuming an IAM role.

You can sign in as a federated identity using credentials from an identity source like AWS IAM Identity Center (IAM Identity Center), single sign-on authentication, or Google/Facebook credentials. For more information about signing in, see How to sign in to your AWS account in the *AWS Sign-In User Guide*.

For programmatic access, AWS provides an SDK and CLI to cryptographically sign requests. For more information, see AWS Signature Version 4 for API requests in the *IAM User Guide*.

AWS account root user

When you create an AWS account, you begin with one sign-in identity called the AWS account *root user* that has complete access to all AWS services and resources. We strongly recommend that you don't use the root user for everyday tasks. For tasks that require root user credentials, see Tasks that require root user credentials in the *IAM User Guide*.

Federated identity

As a best practice, require human users to use federation with an identity provider to access AWS services using temporary credentials.

A *federated identity* is a user from your enterprise directory, web identity provider, or Directory Service that accesses AWS services using credentials from an identity source. Federated identities assume roles that provide temporary credentials.

For centralized access management, we recommend AWS IAM Identity Center. For more information, see What is IAM Identity Center? in the *AWS IAM Identity Center User Guide*.

IAM users and groups

An *IAM user* is an identity with specific permissions for a single person or application. We recommend using temporary credentials instead of IAM users with long-term credentials. For more information, see Require human users to use federation with an identity provider to access AWS using temporary credentials in the *IAM User Guide*.

An *IAM group* specifies a collection of IAM users and makes permissions easier to manage for large sets of users. For more information, see Use cases for IAM users in the *IAM User Guide*.

IAM roles

An *IAM role* is an identity with specific permissions that provides temporary credentials. You can assume a role by switching from a user to an IAM role (console) or by calling an AWS CLI or AWS API operation. For more information, see Methods to assume a role in the *IAM User Guide*.

IAM roles are useful for federated user access, temporary IAM user permissions, cross-account access, cross-service access, and applications running on Amazon EC2. For more information, see Cross account resource access in IAM in the *IAM User Guide*.

Managing access using policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy defines permissions when associated with an identity or resource. AWS evaluates these policies when a principal makes a request. Most policies are stored in AWS as JSON documents. For more information about JSON policy documents, see Overview of JSON policies in the *IAM User Guide*.

Using policies, administrators specify who has access to what by defining which **principal** can perform **actions** on what **resources**, and under what **conditions**.

By default, users and roles have no permissions. An IAM administrator creates IAM policies and adds them to roles, which users can then assume. IAM policies define permissions regardless of the method used to perform the operation.

Identity-based policies

Identity-based policies are JSON permissions policy documents that you attach to an identity (user, group, or role). These policies control what actions identities can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Define custom IAM permissions with customer managed policies in the *IAM User Guide*.

Identity-based policies can be *inline policies* (embedded directly into a single identity) or *managed policies* (standalone policies attached to multiple identities). To learn how to choose between managed and inline policies, see Choose between managed policies and inline policies in the *IAM User Guide*.

Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples include IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. You must specify a principal in a resource-based policy.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

Other policy types

AWS supports additional policy types that can set the maximum permissions granted by more common policy types:

- **Permissions boundaries** – Set the maximum permissions that an identity-based policy can grant to an IAM entity. For more information, see Permissions boundaries for IAM entities in the *IAM User Guide*.
- **Service control policies (SCPs)** – Specify the maximum permissions for an organization or organizational unit in AWS Organizations. For more information, see Service control policies in the *AWS Organizations User Guide*.
- **Resource control policies (RCPs)** – Set the maximum available permissions for resources in your accounts. For more information, see Resource control policies (RCPs) in the *AWS Organizations User Guide*.
- **Session policies** – Advanced policies passed as a parameter when creating a temporary session for a role or federated user. For more information, see Session policies in the *IAM User Guide*.

Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the *IAM User Guide*.

How AWS Config works with IAM

Before you use IAM to manage access to AWS Config, learn what IAM features are available to use with AWS Config.

IAM features you can use with AWS Config

IAM feature	AWS Config support
Identity-based policies	Yes
Resource-based policies	No
Policy actions	Yes
Policy resources	Yes
Policy condition keys (service-specific)	Yes
ACLs	No
ABAC (tags in policies)	Yes
Temporary credentials	Yes
Forward access sessions (FAS)	Yes
Service roles	Yes
Service-linked roles	Yes

To get a high-level view of how AWS Config and other AWS services work with most IAM features, see AWS services that work with IAM in the *IAM User Guide*.

Identity-based policies for AWS Config

Supports identity-based policies: Yes

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can

perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Define custom IAM permissions with customer managed policies in the *IAM User Guide*.

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. To learn about all of the elements that you can use in a JSON policy, see IAM JSON policy elements reference in the *IAM User Guide*.

Identity-based policy examples for AWS Config

To view examples of AWS Config identity-based policies, see Identity-based policy examples for AWS Config.

Resource-based policies within AWS Config

Supports resource-based policies: No

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

To enable cross-account access, you can specify an entire account or IAM entities in another account as the principal in a resource-based policy. For more information, see Cross account resource access in IAM in the *IAM User Guide*.

Policy actions for AWS Config

Supports policy actions: Yes

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Action` element of a JSON policy describes the actions that you can use to allow or deny access in a policy. Include actions in a policy to grant permissions to perform the associated operation.

To see a list of AWS Config actions, see Actions defined by AWS Config in the *Service Authorization Reference*.

Policy actions in AWS Config use the following prefix before the action:

```
config
```

To specify multiple actions in a single statement, separate them with commas.

```
"Action": [
      "config:action1",
      "config:action2"
         ]
```

You can specify multiple actions using wildcards (*). For example, to specify all actions that begin with the word `Describe`, include the following action:

```
"Action": "config:Describe*"
```

To view examples of AWS Config identity-based policies, see Identity-based policy examples for AWS Config.

Policy resources for AWS Config

Supports policy resources: Yes

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Resource` JSON policy element specifies the object or objects to which the action applies. As a best practice, specify a resource using its Amazon Resource Name (ARN). For actions that don't support resource-level permissions, use a wildcard (*) to indicate that the statement applies to all resources.

```
"Resource": "*"
```

To see a list of AWS Config resource types and their ARNs, see Resources defined by AWS Config in the *Service Authorization Reference*. To learn with which actions you can specify the ARN of each resource, see Actions defined by AWS Config.

To view examples of AWS Config identity-based policies, see Identity-based policy examples for AWS Config.

Policy condition keys for AWS Config

Supports service-specific policy condition keys: Yes

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Condition` element specifies when statements execute based on defined criteria. You can create conditional expressions that use condition operators, such as equals or less than, to match the condition in the policy with values in the request. To see all AWS global condition keys, see AWS global condition context keys in the *IAM User Guide*.

To see a list of AWS Config condition keys, see Condition keys for AWS Config in the *Service Authorization Reference*. To learn with which actions and resources you can use a condition key, see Actions defined by AWS Config.

To view examples of AWS Config identity-based policies, see Identity-based policy examples for AWS Config.

ACLs in AWS Config

Supports ACLs: No

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

ABAC with AWS Config

Supports ABAC (tags in policies): Yes

Attribute-based access control (ABAC) is an authorization strategy that defines permissions based on attributes called tags. You can attach tags to IAM entities and AWS resources, then design ABAC policies to allow operations when the principal's tag matches the tag on the resource.

To control access based on tags, you provide tag information in the condition element of a policy using the `aws:ResourceTag/`*`key-name`*, `aws:RequestTag/`*`key-name`*, or `aws:TagKeys` condition keys.

If a service supports all three condition keys for every resource type, then the value is **Yes** for the service. If a service supports all three condition keys for only some resource types, then the value is **Partial**.

For more information about ABAC, see Define permissions with ABAC authorization in the *IAM User Guide*. To view a tutorial with steps for setting up ABAC, see Use attribute-based access control (ABAC) in the *IAM User Guide*.

For more information about tagging AWS Config resources, see Tagging Your AWS Config Resources.

Using temporary credentials with AWS Config

Supports temporary credentials: Yes

Temporary credentials provide short-term access to AWS resources and are automatically created when you use federation or switch roles. AWS recommends that you dynamically generate temporary credentials instead of using long-term access keys. For more information, see Temporary security credentials in IAM and AWS services that work with IAM in the *IAM User Guide*.

Forward access sessions for AWS Config

Supports forward access sessions (FAS): Yes

Forward access sessions (FAS) use the permissions of the principal calling an AWS service, combined with the requesting AWS service to make requests to downstream services. For policy details when making FAS requests, see Forward access sessions.

Service roles for AWS Config

Supports service roles: Yes

A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Create a role to delegate permissions to an AWS service in the *IAM User Guide*.

> **Warning**
>
> Changing the permissions for a service role might break AWS Config functionality. Edit service roles only when AWS Config provides guidance to do so.

Service-linked roles for AWS Config

Supports service-linked roles: Yes

A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your AWS account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

For details about creating or managing AWS Config service-linked roles, see Using Service-Linked Roles for AWS Config.

For details about creating or managing service-linked roles, see AWS services that work with IAM. Find a service in the table that includes a `Yes` in the **Service-linked role** column. Choose the **Yes** link to view the service-linked role documentation for that service.

Identity-based policy examples for AWS Config

By default, users and roles don't have permission to create or modify AWS Config resources. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies.

To learn how to create an IAM identity-based policy by using these example JSON policy documents, see Create IAM policies (console) in the *IAM User Guide*.

For details about actions and resource types defined by AWS Config, including the format of the ARNs for each of the resource types, see Actions, resources, and condition keys for AWS Config in the *Service Authorization Reference*.

Topics

- Policy best practices

Policy best practices

Identity-based policies determine whether someone can create, access, or delete AWS Config resources in your account. These actions can incur costs for your AWS account. When you create or edit identity-based policies, follow these guidelines and recommendations:

- **Get started with AWS managed policies and move toward least-privilege permissions** – To get started granting permissions to your users and workloads, use the *AWS managed policies* that grant permissions for many common use cases. They are available in your AWS account. We recommend that you reduce permissions further by defining AWS customer managed policies that are specific to your use cases. For more information, see AWS managed policies or AWS managed policies for job functions in the *IAM User Guide*.
- **Apply least-privilege permissions** – When you set permissions with IAM policies, grant only the permissions required to perform a task. You do this by defining the actions that can be taken on specific resources under specific conditions, also known as *least-privilege permissions*. For more information about using IAM to apply permissions, see Policies and permissions in IAM in the *IAM User Guide*.
- **Use conditions in IAM policies to further restrict access** – You can add a condition to your policies to limit access to actions and resources. For example, you can write a policy condition to specify that all requests must be sent using SSL. You can also use conditions to grant access to service actions if they are used through a specific AWS service, such as CloudFormation. For more information, see IAM JSON policy elements: Condition in the *IAM User Guide*.
- **Use IAM Access Analyzer to validate your IAM policies to ensure secure and functional permissions** – IAM Access Analyzer validates new and existing policies so that the policies adhere to the IAM policy language (JSON) and IAM best practices. IAM Access Analyzer provides more than 100 policy checks and actionable recommendations to help you author secure and functional policies. For more information, see Validate policies with IAM Access Analyzer in the *IAM User Guide*.
- **Require multi-factor authentication (MFA)** – If you have a scenario that requires IAM users or a root user in your AWS account, turn on MFA for additional security. To require MFA when API operations are called, add MFA conditions to your policies. For more information, see Secure API access with MFA in the *IAM User Guide*.

For more information about best practices in IAM, see Security best practices in IAM in the *IAM User Guide*.

Sign up for an AWS account

To get started with AWS, you need an AWS account. For information about creating an AWS account, see Getting started with an AWS account in the *AWS Account Management Reference Guide*.

Using the AWS Config console

To access the AWS Config console, you must have a minimum set of permissions. These permissions must allow you to list and view details about the AWS Config resources in your AWS account. If you create an identity-based policy that is more restrictive than the minimum required permissions, the console won't function as intended for entities (users or roles) with that policy.

You don't need to allow minimum console permissions for users that are making calls only to the AWS CLI or the AWS API. Instead, allow access to only the actions that match the API operation that they're trying to perform.

To ensure that users and roles can still use the AWS Config console, also attach the AWS Config `AWSConfigUserAccess` AWS managed policy to the entities. For more information, see Adding permissions to a user in the *IAM User Guide*.

You must give users permissions to interact with AWS Config. For users who need full access to AWS Config, use the Full access to AWS Config managed policy.

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

  Create a permission set. Follow the instructions in Create a permission set in the *AWS IAM Identity Center User Guide*.
- Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in Create a role for a third-party identity provider (federation) in the *IAM User Guide*.
- IAM users:
  - Create a role that your user can assume. Follow the instructions in Create a role for an IAM user in the *IAM User Guide*.
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the *IAM User Guide*.

Allow users to view their own permissions

This example shows how you might create a policy that allows IAM users to view the inline and managed policies that are attached to their user identity. This policy includes permissions to complete this action on the console or programmatically using the AWS CLI or AWS API.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "ViewOwnUserInfo",
            "Effect": "Allow",
            "Action": [
                "iam:GetUserPolicy",
                "iam:ListGroupsForUser",
                "iam:ListAttachedUserPolicies",
                "iam:ListUserPolicies",
                "iam:GetUser"
            ],
            "Resource": ["arn:aws:iam::*:user/${aws:username}"]
        },
        {
            "Sid": "NavigateInConsole",
            "Effect": "Allow",
            "Action": [
                "iam:GetGroupPolicy",
                "iam:GetPolicyVersion",
                "iam:GetPolicy",
                "iam:ListAttachedGroupPolicies",
                "iam:ListGroupPolicies",
                "iam:ListPolicyVersions",
                "iam:ListPolicies",
                "iam:ListUsers"
            ],
            "Resource": "*"
        }
    ]
}
```

Read-only access to AWS Config

The following example shows an AWS managed policy, `AWSConfigUserAccess` that grants read-only access to AWS Config.

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "config:Get*",
        "config:Describe*",
        "config:Deliver*",
        "config:List*",
        "config:Select*",
        "tag:GetResources",
        "tag:GetTagKeys",
        "cloudtrail:DescribeTrails",
        "cloudtrail:GetTrailStatus",
        "cloudtrail:LookupEvents"
      ],
      "Resource": "*"
    }
  ]
}
```

In the policy statements, the `Effect` element specifies whether the actions are allowed or denied. The `Action` element lists the specific actions that the user is allowed to perform. The `Resource` element lists the AWS resources the user is allowed to perform those actions on. For policies that control access to AWS Config actions, the `Resource` element is always set to `*`, a wildcard that means "all resources."

The values in the `Action` element correspond to the APIs that the services support. The actions are preceded by `config:` to indicate that they refer to AWS Config actions. You can use the `*` wildcard character in the `Action` element, such as in the following examples:

- `"Action": ["config:*ConfigurationRecorder"]`

This allows all AWS Config actions that end with "ConfigurationRecorder" (`StartConfigurationRecorder`, `StopConfigurationRecorder`).

- `"Action": ["config:*"]`

  This allows all AWS Config actions, but not actions for other AWS services.

- `"Action": ["*"]`

  This allows all AWS actions. This permission is suitable for a user who acts as an AWS administrator for your account.

The read-only policy doesn't grant user permission for the actions such as `StartConfigurationRecorder`, `StopConfigurationRecorder`, and `DeleteConfigurationRecorder`. Users with this policy are not allowed to start configuration recorder, stop configuration recorder, or delete configuration recorder. For the list of AWS Config actions, see the AWS Config API Reference.

Full access to AWS Config

The following example shows a policy that grants full access to AWS Config. It grants users the permission to perform all AWS Config actions. It also lets users manage files in Amazon S3 buckets and manage Amazon SNS topics in the account that the user is associated with.

> **Important**
>
> This policy grants broad permissions. Before granting full access, consider starting with a minimum set of permissions and granting additional permissions as necessary. Doing so is better practice than starting with permissions that are too lenient and then trying to tighten them later.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
```

```
            "Action": [
                "sns:AddPermission",
                "sns:CreateTopic",
                "sns:DeleteTopic",
                "sns:GetTopicAttributes",
                "sns:ListPlatformApplications",
                "sns:ListTopics",
                "sns:SetTopicAttributes"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:CreateBucket",
                "s3:GetBucketAcl",
                "s3:GetBucketLocation",
                "s3:GetBucketNotification",
                "s3:GetBucketPolicy",
                "s3:GetBucketRequestPayment",
                "s3:GetBucketVersioning",
                "s3:ListAllMyBuckets",
                "s3:ListBucket",
                "s3:ListBucketMultipartUploads",
                "s3:ListBucketVersions",
                "s3:PutBucketPolicy"
            ],
            "Resource": "arn:aws:s3:::*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:CreateRole",
                "iam:GetRole",
                "iam:GetRolePolicy",
                "iam:ListRolePolicies",
                "iam:ListRoles",
                "iam:PutRolePolicy",
                "iam:AttachRolePolicy",
                "iam:CreatePolicy",
                "iam:CreatePolicyVersion",
                "iam:DeletePolicyVersion",
                "iam:CreateServiceLinkedRole"
            ],
```

```
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:PassRole"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "iam:PassedToService": [
                        "config.amazonaws.com",
                        "ssm.amazonaws.com"
                    ]
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "cloudtrail:DescribeTrails",
                "cloudtrail:GetTrailStatus",
                "cloudtrail:LookupEvents"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "config:*",
                "tag:Get*"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ssm:DescribeDocument",
                "ssm:GetDocument",
                "ssm:DescribeAutomationExecutions",
                "ssm:GetAutomationExecution",
                "ssm:ListDocuments",
                "ssm:StartAutomationExecution"
            ],
```

```
            "Resource": "*"
        }

    ]
}
```

Supported Resource-Level Permissions for AWS Config Rule API Actions

Resource-level permissions refers to the ability to specify which resources users are allowed to perform actions on. AWS Config supports resource-level permissions for certain AWS Config rule API actions. This means that for certain AWS Config rule actions, you can control the conditions under which when users are allowed to use those actions. These conditions can be actions that must be fulfilled, or specific resources that users are allowed to use.

The following table describes the AWS Config rule API actions that currently support resource-level permissions. It also describes the supported resources and their ARNs for each action. When specifying an ARN, you can use the * wildcard in your paths; for example, when you cannot or do not want to specify exact resource IDs.

> **Important**
>
> If an AWS Config rule API action is not listed in this table, then it does not support resource-level permissions. If an AWS Config rule action does not support resource-level permissions, you can grant users permissions to use the action, but you have to specify a * for the resource element of your policy statement.

API Action	Resources
DeleteConfigRule	Config Rule arn:aws:config:*region:accountID* :config-rule/config-rule-*ID*
DeleteEvaluationResults	Config Rule arn:aws:config:*region:accountID* :config-rule/config-rule-*ID*

API Action	Resources
DescribeComplianceByConfigRule	Config Rule arn:aws:config:*region:accountID* :config-rule/config-rule-*ID*
DescribeConfigRuleEvaluationStatus	Config Rule arn:aws:config:*region:accountID* :config-rule/config-rule-*ID*
GetComplianceDetailsByConfigRule	Config Rule arn:aws:config:*region:accountID* :config-rule/config-rule-*ID*
PutConfigRule	Config Rule arn:aws:config:*region:accountID* :config-rule/config-rule-*ID*
StartConfigRulesEvaluation	Config Rule arn:aws:config:*region:accountID* :config-rule/config-rule-*ID*
PutRemediationConfigurations	Remediation Configuration arn:aws:config:*region:accountId* :remediation-configuration/*config rule name/remediation configuration id*
DescribeRemediationConfigurations	Remediation Configuration arn:aws:config:*region:accountId* :remediation-configuration/*config rule name/remediation configuration id*

API Action	Resources
DeleteRemediationConfiguration	Remediation Configuration arn:aws:config:*region:accountId* :remediation-configuration/*config rule name/remediation configuration id*
PutRemediationExceptions	Remediation Configuration arn:aws:config:*region:accountId* :remediation-configuration/*config rule name/remediation configuration id*
DescribeRemediationExceptions	Remediation Configuration arn:aws:config:*region:accountId* :remediation-configuration/*config rule name/remediation configuration id*
DeleteRemediationExceptions	Remediation Configuration arn:aws:config:*region:accountId* :remediation-configuration/*config rule name/remediation configuration id*

For example, you want to allow read access and deny write access to specific rules to specific users.

In the first policy, you allow the AWS Config rule read actions such as `DescribeConfigRuleEvaluationStatus` on the specified rules.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
```

```
            "Action": [
                "config:StartConfigRulesEvaluation",
                "config:DescribeComplianceByConfigRule",
                "config:DescribeConfigRuleEvaluationStatus",
                "config:GetComplianceDetailsByConfigRule"
            ],
            "Resource": [
                "arn:aws:config:us-east-1:123456789012:config-rule/config-
rule-ID",
                "arn:aws:config:us-east-1:123456789012:config-rule/config-
rule-ID"
            ]
        }
    ]
}
```

In the second policy, you deny the AWS Config rule write actions on the specific rule.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Deny",
            "Action": [
                "config:PutConfigRule",
                "config:DeleteConfigRule",
                "config:DeleteEvaluationResults"
            ],
            "Resource": "arn:aws:config:us-east-1:123456789012:config-rule/
config-rule-ID"
        }
    ]
}
```

With resource-level permissions, you can allow read access and deny write access to perform specific actions on AWS Config rule API actions.

Supported Resource-Level Permissions for Multi-Account Multi-Region Data Aggregation

You can use resource-level permissions to control a user's ability to perform specific actions on multi-account multi-region data aggregation. The following AWS Config `Aggregator` APIs support resource level permissions:

- BatchGetAggregateResourceConfig
- DeleteConfigurationAggregator
- DescribeAggregateComplianceByConfigRules
- DescribeAggregateComplianceByConformancePacks
- DescribeConfigurationAggregatorSourcesStatus
- GetAggregateComplianceDetailsByConfigRule
- GetAggregateConfigRuleComplianceSummary
- GetAggregateConformancePackComplianceSummary
- GetAggregateDiscoveredResourceCounts
- GetAggregateResourceConfig
- ListAggregateDiscoveredResources
- PutConfigurationAggregator
- SelectAggregateResourceConfig

For example, you can restrict access to resource data from specific users by creating two aggregators `AccessibleAggregator` and `InAccessibleAggregator` and attaching an IAM policy that allows access to `AccessibleAggregator` but denies access to `InAccessibleAggregator`.

IAM Policy for AccessibleAggregator

In this policy, you allow access to the supported aggregator actions for the AWS Config Amazon Resource Name (ARN) that you specify. In this example, the AWS Config ARN is `arn:aws:config:ap-northeast-1:`*`AccountID`*`:config-aggregator/config-aggregator-mocpsqhs`.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "ConfigAllow",
            "Effect": "Allow",
            "Action": [
                "config:BatchGetAggregateResourceConfig",
                "config:DeleteConfigurationAggregator",
                "config:DescribeAggregateComplianceByConfigRules",
                "config:DescribeAggregateComplianceByConformancePacks",
                "config:DescribeConfigurationAggregatorSourcesStatus",
                "config:GetAggregateComplianceDetailsByConfigRule",
                "config:GetAggregateConfigRuleComplianceSummary",
                "config:GetAggregateConformancePackComplianceSummary",
                "config:GetAggregateDiscoveredResourceCounts",
                "config:GetAggregateResourceConfig",
                "config:ListAggregateDiscoveredResources",
                "config:PutConfigurationAggregator",
                "config:SelectAggregateResourceConfig"
            ],
            "Resource": "arn:aws:config:ap-northeast-1:111122223333:config-
aggregator/config-aggregator-mocpsqhs"
        }
    ]
}
```

IAM Policy for InAccessibleAggregator

In this policy, you deny access to the supported aggregator actions for the AWS Config ARN that you specify. In this example, the AWS Config ARN is `arn:aws:config:ap-northeast-1:`*`AccountID`*`:config-aggregator/config-aggregator-pokxzldx`.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
```

```
        {
            "Sid": "ConfigDeny",
            "Effect": "Deny",
            "Action": [
                "config:BatchGetAggregateResourceConfig",
                "config:DeleteConfigurationAggregator",
                "config:DescribeAggregateComplianceByConfigRules",
                "config:DescribeAggregateComplianceByConformancePacks",
                "config:DescribeConfigurationAggregatorSourcesStatus",
                "config:GetAggregateComplianceDetailsByConfigRule",
                "config:GetAggregateConfigRuleComplianceSummary",
                "config:GetAggregateConformancePackComplianceSummary",
                "config:GetAggregateDiscoveredResourceCounts",
                "config:GetAggregateResourceConfig",
                "config:ListAggregateDiscoveredResources",
                "config:PutConfigurationAggregator",
                "config:SelectAggregateResourceConfig"
            ],
            "Resource": "arn:aws:config:ap-northeast-1:111122223333:config-
aggregator/config-aggregator-pokxzldx"
        }
    ]
}
```

If a user of the developer group tries to perform any of these actions on the AWS Config ARN that you specified, that user will get an access denied exception.

Checking User Access Permissions

To show the aggregators that you have created, run the following AWS CLI command:

```
aws configservice describe-configuration-aggregators
```

When command has successfully completed, you will be able to see the details for all the aggregators associated with your account. In this example, those are `AccessibleAggregator` and `InAccessibleAggregator`:

```
{
    "ConfigurationAggregators": [
        {
            "ConfigurationAggregatorArn": "arn:aws:config:ap-
northeast-1:AccountID:config-aggregator/config-aggregator-mocpsqhs",
```

```
            "CreationTime": 1517942461.442,
            "ConfigurationAggregatorName": "AccessibleAggregator",
            "AccountAggregationSources": [
                {
                    "AllAwsRegions": true,
                    "AccountIds": [
                        "AccountID1",
                        "AccountID2",
                        "AccountID3"
                    ]
                }
            ],
            "LastUpdatedTime": 1517942461.455
        },
        {
            "ConfigurationAggregatorArn": "arn:aws:config:ap-
northeast-1:AccountID:config-aggregator/config-aggregator-pokxzldx",
            "CreationTime": 1517942461.442,
            "ConfigurationAggregatorName": "InAccessibleAggregator",
            "AccountAggregationSources": [
                {
                    "AllAwsRegions": true,
                    "AccountIds": [
                        "AccountID1",
                        "AccountID2",
                        "AccountID3"
                    ]
                }
            ],
            "LastUpdatedTime": 1517942461.455
        }
    ]
}
```

Note

For `account-aggregation-sources` enter a comma-separated list of AWS account IDs for which you want to aggregate data. Wrap the account IDs in square brackets, and be sure to escape quotation marks (for example, `"[{\"AccountIds\": [\"AccountID1\",\"AccountID2\",\"AccountID3\"],\"AllAwsRegions\": true}]"`).

Attach the following IAM policy to deny access to `InAccessibleAggregator`, or the aggregator to which you want to deny access.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "ConfigDeny",
            "Effect": "Deny",
            "Action": [
                "config:BatchGetAggregateResourceConfig",
                "config:DeleteConfigurationAggregator",
                "config:DescribeAggregateComplianceByConfigRules",
                "config:DescribeAggregateComplianceByConformancePacks",
                "config:DescribeConfigurationAggregatorSourcesStatus",
                "config:GetAggregateComplianceDetailsByConfigRule",
                "config:GetAggregateConfigRuleComplianceSummary",
                "config:GetAggregateConformancePackComplianceSummary",
                "config:GetAggregateDiscoveredResourceCounts",
                "config:GetAggregateResourceConfig",
                "config:ListAggregateDiscoveredResources",
                "config:PutConfigurationAggregator",
                "config:SelectAggregateResourceConfig"
            ],
            "Resource": "arn:aws:config:ap-northeast-1:111122223333:config-
aggregator/config-aggregator-pokxzldx"
        }
    ]
}
```

Next, you can confirm that the IAM policy works for restricting access to rules for a specific aggregator:

```
aws configservice get-aggregate-compliance-details-by-config-rule --configuration-
aggregator-name InAccessibleAggregator --config-rule-name rule name --account-
id AccountID --aws-region AwsRegion
```

The command should return an access denied exception:

```
An error occurred (AccessDeniedException) when calling the
 GetAggregateComplianceDetailsByConfigRule operation: User:
 arn:aws:iam::AccountID:user/ is not
authorized to perform: config:GetAggregateComplianceDetailsByConfigRule on resource:
 arn:aws:config:AwsRegion-1:AccountID:config-aggregator/config-aggregator-pokxzldx
```

AWS managed policies for AWS Config

An AWS managed policy is a standalone policy that is created and administered by AWS. AWS managed policies are designed to provide permissions for many common use cases so that you can start assigning permissions to users, groups, and roles.

Keep in mind that AWS managed policies might not grant least-privilege permissions for your specific use cases because they're available for all AWS customers to use. We recommend that you reduce permissions further by defining customer managed policies that are specific to your use cases.

You cannot change the permissions defined in AWS managed policies. If AWS updates the permissions defined in an AWS managed policy, the update affects all principal identities (users, groups, and roles) that the policy is attached to. AWS is most likely to update an AWS managed policy when a new AWS service is launched or new API operations become available for existing services.

For more information, see AWS managed policies in the *IAM User Guide*.

AWS managed policy: AWSConfigServiceRolePolicy

AWS Config uses the service-linked role named **AWSServiceRoleForConfig** to call other AWS services on your behalf. When you use the AWS Management Console to set up AWS Config, this SLR is automatically created by AWS Config if you select the option to use the AWS Config SLR instead of your own AWS Identity and Access Management (IAM) service role.

The **AWSServiceRoleForConfig** SLR contains the managed policy `AWSConfigServiceRolePolicy`. This managed policy contains read-only and write-only permissions for AWS Config resources and read-only permissions for resources in other services that AWS Config supports. The policy provides comprehensive access to monitor and record

configuration changes across your AWS infrastructure, including permissions for over 100 AWS services such as compute, storage, networking, security, analytics, and machine learning services.

The policy includes permissions for the following service categories:

- `access-analyzer` – Allows principals to analyze access patterns and retrieve security findings.
- `account` – Allows principals to retrieve account contact information.
- `acm` and `acm-pca` – Allows principals to manage SSL/TLS certificates and private certificate authorities.
- `airflow` – Allows principals to monitor managed Apache Airflow environments.
- `amplify` and `amplifyuibuilder` – Allows principals to monitor web applications and UI components.
- `aoss` – Allows principals to monitor OpenSearch Serverless collections and security configurations.
- `app-integrations` – Allows principals to monitor application integration configurations.
- `appconfig` – Allows principals to monitor application configuration deployments.
- `appflow` – Allows principals to monitor data flow configurations between applications.
- `application-autoscaling` and `application-signals` – Allows principals to monitor auto-scaling policies and application performance metrics.
- `appmesh` – Allows principals to monitor service mesh configurations.
- `apprunner` – Allows principals to monitor containerized web applications and services.
- `appstream` – Allows principals to monitor application streaming configurations.
- `appsync` – Allows principals to monitor GraphQL API configurations.
- `aps` – Allows principals to monitor Prometheus monitoring configurations.
- `apptest` – Allows principals to monitor application testing configurations.
- `arc-zonal-shift` – Allows principals to monitor zonal shift configurations for availability.
- `athena` – Allows principals to monitor query engine configurations and data catalogs.
- `auditmanager` – Allows principals to monitor audit and compliance assessments.
- `autoscaling` and `autoscaling-plans` – Allows principals to monitor auto-scaling groups and scaling plans.
- `b2bi` – Allows principals to monitor business-to-business integration configurations.
- `backup` and `backup-gateway` – Allows principals to monitor backup policies and gateway configurations.

- `batch` – Allows principals to monitor batch computing environments and job queues.
- `bcm-data-exports` – Allows principals to monitor billing and cost management data exports.
- `bedrock` and `bedrock-agentcore` – Allows principals to monitor foundation models and AI agent configurations.
- `billingconductor` – Allows principals to monitor billing group configurations.
- `budgets` – Allows principals to monitor budget configurations and actions.
- `cassandra` – Allows principals to query managed Cassandra database configurations.
- `ce` – Allows principals to monitor cost and usage reporting configurations.
- `cleanrooms` and `cleanrooms-ml` – Allows principals to monitor data collaboration and machine learning configurations.
- `cloud9` – Allows principals to monitor cloud development environment configurations.
- `cloudformation` – Allows principals to monitor infrastructure as code stack configurations.
- `cloudfront` – Allows principals to monitor content delivery network configurations.
- `cloudtrail` – Allows principals to monitor API logging and audit trail configurations.
- `cloudwatch` – Allows principals to monitor metrics, alarms, and dashboard configurations.
- `codeartifact` – Allows principals to monitor software package repository configurations.
- `codebuild` – Allows principals to monitor build project configurations.
- `codecommit` – Allows principals to monitor source code repository configurations.
- `codeconnections` – Allows principals to monitor third-party source connections.
- `codedeploy` – Allows principals to monitor application deployment configurations.
- `codeguru-profiler` and `codeguru-reviewer` – Allows principals to monitor code analysis and profiling configurations.
- `codepipeline` – Allows principals to monitor continuous integration and deployment pipeline configurations.
- `codestar-connections` – Allows principals to monitor developer tool connections.
- `cognito-identity` and `cognito-idp` – Allows principals to monitor identity and user pool configurations.
- `comprehend` – Allows principals to monitor natural language processing configurations.
- `config` – Allows principals to manage configuration recording and compliance monitoring.
- `connect` – Allows principals to monitor contact center configurations.

For more information about supported resource types, see Supported Resource Types for AWS Config and Using Service-Linked Roles for AWS Config.

To view more details about the policy, including the latest version of the JSON policy document, see AWSConfigServiceRolePolicy in the *AWS Managed Policy Reference Guide*.

> **Recommended: Use the Service-linked role**
>
> It is recommended that you use the service-linked role unless you have a particular use case. A service-linked role adds all the necessary permissions for AWS Config to run as expected. Some features such as service-linked configuration recorders require you to use the service-linked role.

AWS managed policy: AWS_ConfigRole

To record your AWS resource configurations, AWS Config requires IAM permissions to get the configuration details about your resources. If you want to create an IAM role for AWS Config, you can use the managed policy `AWS_ConfigRole` and attach it to your IAM role.

This IAM policy is updated each time AWS Config adds support for an AWS resource type. This means that AWS Config will continue to have the required permissions to record configuration data of supported resource types as long as the **AWS_ConfigRole** role has this managed policy attached. The policy provides comprehensive access to monitor and record configuration changes across your AWS infrastructure, including permissions for over 100 AWS services such as compute, storage, networking, security, analytics, and machine learning services. For more information, see Supported Resource Types for AWS Config and Permissions for the IAM Role Assigned to AWS Config.

To view more details about the policy, including the latest version of the JSON policy document, see AWS_ConfigRole in the *AWS Managed Policy Reference Guide*.

AWS managed policy: AWSConfigUserAccess

This IAM policy provides access to use AWS Config, including searching by tags on resources and reading all tags. This does not provide permission to configure AWS Config, which requires administrative privileges.

View the policy: AWSConfigUserAccess.

AWS managed policy: ConfigConformsServiceRolePolicy

To deploy and manage conformance packs, AWS Config requires IAM permissions and certain permissions from other AWS services. These allow you to deploy and manage conformance packs with full functionality and are updated each time AWS Config adds new functionality for conformance packs. For more information on conformance packs, see Conformance packs.

View the policy: ConfigConformsServiceRolePolicy.

AWS managed policy: AWSConfigRulesExecutionRole

To deploy AWS Custom Lambda Rules, AWS Config requires IAM permissions and certain permissions from other AWS services. These allow AWS Lambda functions to access the AWS Config API and the configuration snapshots that AWS Config delivers periodically to Amazon S3. This access is required by functions that evaluate configuration changes for AWS Custom Lambda rules and is updated each time AWS Config adds new functionality. For more information on AWS Custom Lambda Rules, see Creating AWS Config Custom Lambda Rules. For more information on configuration snapshots, see Concepts | Configuration Snapshot. For more information on the delivery of configuration snapshots, see Managing the Delivery Channel.

View the policy: AWSConfigRulesExecutionRole.

AWS managed policy: AWSConfigMultiAccountSetupPolicy

To centrally deploy, update, and delete AWS Config rules and conformance packs across member accounts in an organization in AWS Organizations, AWS Config requires IAM permissions and certain permissions from other AWS services. This managed policy is updated each time AWS Config adds new functionality for multi-account setup. For more information, see Managing AWS Config Rules Across All Accounts in Your Organization and Managing Conformance Packs Across All Accounts in Your Organization.

View the policy: AWSConfigMultiAccountSetupPolicy.

AWS managed policy: AWSConfigRoleForOrganizations

To allow AWS Config to call read-only AWS Organizations APIs, AWS Config requires IAM permissions and certain permissions from other AWS services. This managed policy is updated each time AWS Config adds new functionality for multi-account setup. For more information, see Managing AWS Config Rules Across All Accounts in Your Organization and Managing Conformance Packs Across All Accounts in Your Organization.

View the policy: AWSConfigRoleForOrganizations.

AWS managed policy: AWSConfigRemediationServiceRolePolicy

To allow AWS Config to remediate `NON_COMPLIANT` resources on your behalf, AWS Config requires IAM permissions and certain permissions from other AWS services. This managed policy is updated each time AWS Config adds new functionality for remediation. For more information on remediation, see Remediating Noncompliant Resources with AWS Config Rules. For more information on the conditions that initiate the possible AWS Config evaluation results, see Concepts | AWS Config Rules.

View the policy: AWSConfigRemediationServiceRolePolicy.

AWS Config updates to AWS managed policies

View details about updates to AWS managed policies for AWS Config since this service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the AWS Config Document history page.

Change	Description	Date
AWSConfigRulesExecutionRole – AWS Config starts tracking changes for this AWS managed policy	This policy allow AWS Lambda functions to access the AWS Config API and the configuration snapshots that AWS Config delivers periodically to Amazon S3. This access is required by functions that evaluate configuration changes for AWS Custom Lambda rules.	March 7, 2023
AWSConfigRoleForOrganizations – AWS Config starts tracking changes for this AWS managed policy	This policy allows AWS Config to call read-only AWS Organizations APIs.	March 7, 2023
AWSConfigRemediationServiceRolePolicy – AWS Config starts tracking changes for this AWS managed policy	This policy allows AWS Config to remediate `NON_COMPLIANT` resources on your behalf.	March 7, 2023
AWSConfigServiceRolePolicy – Add auditmanager:GetAccountStatus	This policy now grants permission to return the registration status of an account in AWS Audit Manager.	March 3, 2023
AWS_ConfigRole – Add auditmanager:GetAccountStatus	This policy now grants permission to return the registration status of an account in AWS Audit Manager.	March 3, 2023

Change	Description	Date
AWSConfigMultiAccountSetupPolicy – AWS Config starts tracking changes for this AWS managed policy	This policy allows AWS Config to call AWS services and deploy AWS Config resources across an organization with AWS Organizations.	February 27, 2023

Change	Description	Date
AWSConfigServiceRolePolicy – Add airflow:ListTagsForResource, iot:ListCustomMetrics, iot:DescribeCustomMetric, appstream:DescribeDirectoryConfigs, appstream:ListTagsForResource, codeguru-reviewer:DescribeRepositoryAssociation, codeguru-reviewer:ListRepositoryAssociations, healthlake:ListFHIRDatastores, healthlake:DescribeFHIRDatastore, healthlake:ListTagsForResource, kinesisvideo:DescribeStream, kinesisvideo:ListStreams, kinesisvideo:ListTagsForStream, kinesisvideo:DescribeSignalingChannel, kinesisvideo:ListTagsForResource, kinesisvideo:ListSignalingChannels, route53-recovery-control-config:DescribeCluster, route53-recovery-control-config:DescribeRoutingControl, route53-recovery-control-config:DescribeSafetyRule, route53-recovery-control-config:ListClusters, route53-recovery-control-config:ListRoutingControls, route53-recovery-control-config:ListSafetyRules, devicefarm:GetTestGridProject, devicefar	This policy now supports additional permissions for Amazon Managed Workflows for Apache Airflow, AWS IoT, Amazon WorkSpaces Applications, Amazon CodeGuru Reviewer, AWS HealthLake, Amazon Kinesis Video Streams, Amazon Application Recovery Controller (ARC), AWS Device Farm, Amazon Elastic Compute Cloud (Amazon EC2), Amazon Pinpoint, AWS Identity and Access Management (IAM), Amazon GuardDuty, and Amazon CloudWatch Logs.	February 1, 2023

Change	Description	Date

ConfigConformsServiceRolePolicy – Update config:DescribeConfigRules	As a security best practice, this policy now removes broad resource-level permission for `config:DescribeConfigRules` .	January 12, 2023

Change	Description	Date
AWSConfigServiceRolePolicy – Add APS:DescribeRuleGroupsNamespace, APS:DescribeWorkspace, APS:ListWorkspaces, auditmanager:GetAssessment, auditmanager:ListAssessments, devicefarm:GetNetworkProfile, AWS Transfer Family devicefarm:GetProject, devicefarm:ListNetworkProfiles, devicefarm:ListTagsForResource, dms:DescribeEndpoints, ds:ListTagsForResource, ec2:DescribeTags, ec2:DescribeTrafficMirrorSessions, ec2:DescribeTrafficMirrorTargets, ec2:GetIpamPoolAllocations, ec2:GetIpamPoolCidrs, glue:GetMLTransform, glue:GetMLTransforms, glue:ListMLTransforms, iot:DescribeScheduledAudit, iot:ListScheduledAudits, ivs:GetChannel, lightsail:GetRelationalDatabases, mediapackage-vod:DescribePackagingConfiguration, mediapackage-vod:ListPackagingConfigurations, networkmanager:DescribeGlobalNetworks, networkmanager:GetTransitGatewayRegistrations,	This policy now supports additional permissions for Amazon Managed Service for Prometheus, AWS Audit Manager, AWS Device Farm, AWS Database Migration Service (AWS DMS), AWS Directory Service, Amazon Elastic Compute Cloud (Amazon EC2), AWS Glue, AWS IoT, Amazon Lightsail, AWS Elemental MediaPackage, AWS Network Manager, Amazon Quick, AWS Resource Access Manager, Amazon Application Recovery Controller (ARC), Amazon Simple Storage Service (Amazon S3), and Amazon Timestream.	Decemeber 15, 2022

Change	Description	Date
networkmanager:ListTagsForResource, quicksight:DescribeDashboard, quicksight:DescribeDashboardPermissions, quicksight:DescribeTemplate, quicksight:DescribeTemplatePermissions, quicksight:ListDashboards, quicksight:ListTemplates, ram:ListResources, route53-recovery-control-config:DescribeControlPanel, route53-recovery-control-config:ListControlPanels, route53-recovery-control-config:ListTagsForResource, route53resolver:GetResolverQueryLogConfigAssociation, route53resolver:ListResolverQueryLogConfigAssociations, s3:GetAccessPointForObjectLambda, s3:GetAccessPointPolicyForObjectLambda, s3:GetAccessPointPolicyStatusForObjectLambda, s3:GetMultiRegionAccessPoint, s3:ListAccessPointsForObjectLambda, s3:ListMultiRegionAccessPoints, timestream:DescribeEndpoints, transfer:DescribeConnector, transfer:ListConnectors, and transfer:ListTagsForResource		

Change	Description	Date
AWS_ConfigRole – Add APS:DescribeRuleGroupsNamespace, APS:DescribeWorkspace, APS:ListWorkspaces, auditmanager:GetAssessment, auditmanager:ListAssessments, devicefarm:GetNetworkProfile, devicefarm:GetProject, devicefarm:ListNetworkProfiles, devicefarm:ListTagsForResource, dms:DescribeEndpoints, ds:ListTagsForResource, ec2:DescribeTags, ec2:DescribeTrafficMirrorSessions, ec2:DescribeTrafficMirrorTargets, ec2:GetIpamPoolAllocations, ec2:GetIpamPoolCidrs, glue:GetMLTransform, glue:GetMLTransforms, glue:ListMLTransforms, iot:DescribeScheduledAudit, iot:ListScheduledAudits, ivs:GetChannel, lightsail:GetRelationalDatabases, mediapackage-vod:DescribePackagingConfiguration, mediapackage-vod:ListPackagingConfigurations, networkmanager:DescribeGlobalNetworks, networkmanager:GetTransitGatewayRegistrations, networkmanager:ListTagsForResource, quicksight:D	This policy now supports additional permissions for Amazon Managed Service for Prometheus, AWS Audit Manager, AWS Device Farm, AWS Database Migration Service (AWS DMS), AWS Directory Service, Amazon Elastic Compute Cloud (Amazon EC2), AWS Glue, AWS IoT, Amazon Lightsail, AWS Elemental MediaPackage, AWS Network Manager, Amazon Quick, AWS Resource Access Manager, Amazon Application Recovery Controller (ARC), Amazon Simple Storage Service (Amazon S3), and Amazon Timestream.	December 15, 2022

Change	Description	Date
escribeDashboard, quicksight:DescribeDashboardPermissions, quicksight:DescribeTemplate, quicksight:DescribeTemplatePermissions, quicksight:ListDashboards, quicksight:ListTemplates, ram:ListResources, route53-recovery-control-config:DescribeControlPanel, route53-recovery-control-config:ListControlPanels, route53-recovery-control-config:ListTagsForResource, route53resolver:GetResolverQueryLogConfigAssociation, route53resolver:ListResolverQueryLogConfigAssociations, s3:GetAccessPointForObjectLambda, s3:GetAccessPointPolicyForObjectLambda, s3:GetAccessPointPolicyStatusForObjectLambda, s3:GetMultiRegionAccessPoint, s3:ListAccessPointsForObjectLambda, s3:ListMultiRegionAccessPoints, timestream:DescribeEndpoints, transfer:DescribeConnector, transfer:ListConnectors, and transfer:ListTagsForResource		

Change	Description	Date
AWSConfigServiceRolePolicy – Add cloudformation:ListStackResources and cloudformation:ListStacks	This policy now grants permission to return descriptions of all resources of a specified AWS CloudFormation stack and return the summary information for stacks whose status matches the specified StackStatusFilter.	November 7, 2022
AWS_ConfigRole – Add cloudformation:ListStackResources and cloudformation:ListStacks	This policy now grants permission to return descriptions of all resources of a specified AWS CloudFormation stack and return the summary information for stacks whose status matches the specified StackStatusFilter.	November 7, 2022

Change	Description	Date
AWSConfigServiceRolePolicy – Add acm-pca:GetCertificateAuthorityCsr, acm-pca:ListCertificateAuthorities, acm-pca:ListTags, airflow:GetEnvironment, airflow:ListEnvironments, amplifyuibuilder:ListThemes, appconfig:ListConfigurationProfiles, appconfig:ListDeployments, appconfig:ListDeploymentStrategies, appconfig:ListEnvironments, appconfig:ListHostedConfigurationVersions, cassandra:Select, cloudwatch:DescribeAnomalyDetectors, cloudwatch:GetDashboard, cloudwatch:ListDashboards, connect:DescribePhoneNumber, connect:ListPhoneNumbers, connect:ListPhoneNumbersV2, connect:SearchAvailablePhoneNumbers, databrew:DescribeDataset, databrew:DescribeJob, databrew:DescribeProject, databrew:DescribeRecipe, databrew:DescribeRuleset, databrew:DescribeSchedule, databrew:ListDatasets, databrew:ListJobs, databrew:ListProjects, databrew:ListRecipes, databrew:ListRecipeVers	This policy now supports additional permissions for AWS Certificate Manager, Amazon Managed Workflows for Apache Airflow, AWS Amplify, AWS AppConfig, Amazon Keyspaces, Amazon CloudWatch, Connect Customer, AWS Glue DataBrew, Amazon Elastic Compute Cloud (Amazon EC2), Amazon Elastic Kubernetes Service (Amazon EKS), Amazon EventBridge, AWS Fault Injection Service, Amazon Fraud Detector, Amazon FSx, Amazon GameLift Servers, Amazon Location Service, AWS IoT, Amazon Lex, Amazon Lightsail, Amazon Pinpoint, OpsWorks, AWS Panorama, AWS Resource Access Manager, Amazon Quick, Amazon Relational Database Service (Amazon RDS), Amazon Rekognition, AWS RoboMaker, AWS Resource Groups, Amazon Route 53, Amazon Simple Storage Service (Amazon S3), AWS Cloud Map, and AWS Security Token Service. AWSConfigServiceRolePolicy – Add logs:ListTagsLogGroup, states:ListTagsForResource, states:ListStateMachines, states:DescribeStateMachine, and additional permissions for AWS resource types	This policy now grants permission to list tags for a log group, list tags for a state machine, and list all state machines. This policy now grants permission to get details about a state machine. This policy also now supports additional permissions for Amazon EC2 Systems Manager (SSM), Amazon Elastic Container Registry, Amazon FSx, Amazon Data Firehose, Amazon Managed Streaming for Apache Kafka (Amazon MSK), Amazon Relational Database Service (Amazon RDS), Amazon Route 53, Amazon SageMaker AI, Amazon Simple Notification Service, AWS Database Migration Service, AWS Global Accelerator, and AWS Storage Gateway.	July 28, 2021

Change	Description	Date
AWS_ConfigRole – Add logs: ListTagsLogGroup, states:ListTagsForResource, states:ListStateMachines, states:DescribeStateMachine, and additional permissions for AWS resource types	This policy now grants permission to list tags for a log group, list tags for a state machine, and list all state machines. This policy now grants permission to get details about a state machine. This policy also now supports additional permissions for Amazon EC2 Systems Manager (SSM), Amazon Elastic Container Registry, Amazon FSx, Amazon Data Firehose, Amazon Managed Streaming for Apache Kafka (Amazon MSK), Amazon Relational Database Service (Amazon RDS), Amazon Route 53, Amazon SageMaker AI, Amazon Simple Notification Service, AWS Database Migration Service, AWS Global Accelerator, and AWS Storage Gateway.	July 28, 2021

Change	Description	Date
AWSConfigServiceRolePolicy – Add ssm:DescribeDocumentPermission and additional permissions for AWS resource types	This policy now grants permission to view the permissions of AWS Systems Manager documents and information about IAM Access Analyzer. This policy now supports additional AWS resource types for Amazon Kinesis, Amazon ElastiCache, Amazon EMR, AWS Network Firewall, Amazon Route 53, and Amazon Relational Database Service (Amazon RDS). These permission changes allow AWS Config to invoke the read-only APIs required to support these resource types. This policy also now support filtering Lambda@Edge functions for the lambda-inside-vpc AWS Config managed rule.	June 8, 2021

Change	Description	Date
AWS_ConfigRole – Add ssm:DescribeDocumentPermission and additional permissions for AWS resource types	This policy now grants permission to view the permissions of AWS Systems Manager documents and information about IAM Access Analyzer. This policy now supports additional AWS resource types for Amazon Kinesis, Amazon ElastiCache, Amazon EMR, AWS Network Firewall, Amazon Route 53, and Amazon Relational Database Service (Amazon RDS). These permission changes allow AWS Config to invoke the read-only APIs required to support these resource types. This policy also now support filtering Lambda@Edge functions for the lambda-inside-vpc AWS Config managed rule.	June 8, 2021

Change	Description	Date
AWSConfigServiceRolePolicy – Add apigateway:GET permission to make read-only GET calls to API Gateway and s3:GetAccessPointPolicy permission and s3:GetAccessPointPolicyStatus permission to invoke Amazon S3 read-only APIs	This policy now grants permissions that allow AWS Config to make read-only GET calls to API Gateway to support a AWS Config Rule for API Gateway. The policy also adds permissions that allow AWS Config to invoke Amazon Simple Storage Service (Amazon S3) read-only APIs, which are required to support the new `AWS::S3::AccessPoint` resource type.	May 10, 2021
AWS_ConfigRole – Add apigateway:GET permission to make read-only GET calls to API Gateway and s3:GetAccessPointPolicy permission and s3:GetAccessPointPolicyStatus permission to invoke Amazon S3 read-only APIs	This policy now grants permissions that allow AWS Config to make read-only GET calls to API Gateway to support a AWS Config for API Gateway. The policy also adds permissions that allow AWS Config to invoke Amazon Simple Storage Service (Amazon S3) read-only APIs, which are required to support the new `AWS::S3::AccessPoint` resource type.	May 10, 2021

Change	Description	Date
AWSConfigServiceRolePolicy – Add ssm:ListDocuments permission and additional permissions for AWS resource types	This policy now grants permission to view informati on about AWS Systems Manager specified documents . This policy also now supports additional AWS resource types for AWS Backup, Amazon Elastic File System, Amazon ElastiCac he, Amazon Simple Storage Service (Amazon S3), Amazon Elastic Compute Cloud (Amazon EC2), Amazon Kinesis, Amazon SageMaker AI, AWS Database Migration Service, and Amazon Route 53. These permission changes allow AWS Config to invoke the read-only APIs required to support these resource types.	April 1, 2021

Change	Description	Date
AWS_ConfigRole – Add ssm:ListDocuments permission and additional permissions for AWS resource types	This policy now grants permission to view information about AWS Systems Manager specified documents. This policy also now supports additional AWS resource types for AWS Backup, Amazon Elastic File System, Amazon ElastiCache, Amazon Simple Storage Service (Amazon S3), Amazon Elastic Compute Cloud (Amazon EC2), Amazon Kinesis, Amazon SageMaker AI, AWS Database Migration Service, and Amazon Route 53. These permission changes allow AWS Config to invoke the read-only APIs required to support these resource types.	April 1, 2021
`AWSConfigRole` is deprecated	`AWSConfigRole` is deprecated. The replacement policy is `AWS_ConfigRole`.	April 1, 2021
AWS Config started tracking changes	AWS Config started tracking changes for its AWS managed policies.	April 1, 2021

Permissions for the IAM Role Assigned to AWS Config

An IAM role lets you define a set of permissions. AWS Config assumes the role that you assign to it to write to your S3 bucket, publish to your SNS topic, and make `Describe` or `List` API requests to

get configuration details for your AWS resources. For more information about IAM roles, see IAM Roles in the *IAM User Guide*.

When you use the AWS Config console to create or update an IAM role, AWS Config automatically attaches the required permissions for you. For more information, see Setting Up AWS Config with the Console.

> **Policies and compliance results**
>
> IAM policies and other policies managed in AWS Organizations can impact whether AWS Config has permissions to record configuration changes for your resources. Additionally, rules directly evaluate the configuration of a resource and rules don't take into account these policies when running evaluations. Make sure that the policies in effect align with how you intend to use AWS Config.

Contents

- Creating IAM Role Policies
  - Adding an IAM Trust Policy to your Role
  - IAM Role Policy for your S3 Bucket
  - IAM Role Policy for KMS Key
  - IAM Role Policy for Amazon SNS Topic
  - IAM Role Policy for Getting Configuration Details
  - Managing Permissions for S3 Bucket Recording

Creating IAM Role Policies

When you use the AWS Config console to create an IAM role, AWS Config automatically attaches the required permissions to the role for you.

If you are using the AWS CLI to set up AWS Config or you are updating an existing IAM role, you must manually update the policy to allow AWS Config to access your S3 bucket, publish to your SNS topic, and get configuration details about your resources.

Adding an IAM Trust Policy to your Role

You can create an IAM trust policy that enables AWS Config to assume a role and use it to track your resources. For more information about trust policies, see Roles terms and concepts in the *IAM User Guide*.

The following is an example trust policy for AWS Config roles:

        }
      }
    }
  ]
}
```

You can use the `AWS:SourceAccount` condition in the IAM Role Trust relationship above to restrict the Config service principal to only interact with the AWS IAM Role when performing operations on behalf of specific accounts.

AWS Config also supports the `AWS:SourceArn` condition which restricts the Config service principal to only assume the IAM Role when performing operations on behalf of the owning account. When using the AWS Config service principal, the `AWS:SourceArn` property will always be set to `arn:aws:config:sourceRegion:sourceAccountID:*` where `sourceRegion` is the region of the customer managed configuration recorder and `sourceAccountID` is the ID of the account containing the customer managed configuration recorder.

For example, add the following condition restrict the Config service principal to only assume the IAM Role only on behalf of a customer managed configuration recorder in the `us-east-1` region in the account `123456789012`: `"ArnLike": {"AWS:SourceArn": "arn:aws:config:us-east-1:123456789012:*"}`.

IAM Role Policy for your S3 Bucket

The following example policy grants AWS Config permission to access your S3 bucket:

JSON

```
{
  "Version":"2012-10-17",
  "Statement":[
    {
      "Effect":"Allow",
      "Action":[
        "s3:PutObject",
        "s3:PutObjectAcl"
      ],
      "Resource":[
        "arn:aws:s3:::amzn-s3-demo-bucket/prefix/AWSLogs/myAccountID/*"
      ],
      "Condition":{
        "StringLike":{
          "s3:x-amz-acl":"bucket-owner-full-control"
        }
      }
    },
    {
      "Effect":"Allow",
      "Action":[
        "s3:GetBucketAcl"
      ],
      "Resource":"arn:aws:s3:::amzn-s3-demo-bucket"
    }
  ]
}
```

IAM Role Policy for KMS Key

The following example policy grants AWS Config permission to use KMS-based encryption on new objects for S3 bucket delivery:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "kms:Decrypt",
                "kms:GenerateDataKey"
            ],
            "Resource": "arn:aws:kms:us-
east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
        }
    ]
}
```

IAM Role Policy for Amazon SNS Topic

The following example policy grants AWS Config permission to access your SNS topic:

JSON

```
{
  "Version":"2012-10-17",
  "Statement":
   [
     {
      "Effect":"Allow",
      "Action":"sns:Publish",
      "Resource":"arn:aws:sns:us-east-1:123456789012:MyTopic"
     }
    ]
}
```

If your SNS topic is encrypted for additional setup instructions, see Configuring AWS KMS Permissions in the *Amazon Simple Notification Service Developer Guide*.

IAM Role Policy for Getting Configuration Details

It is recommended to use the AWS Config service-linked role: `AWSServiceRoleForConfig`. Service-linked roles are predefined and include all the permissions that AWS Config requires to call other AWS services. The AWS Config service-linked role is required for service-linked configuration recorders. For more information, see Using Service-Linked Roles for AWS Config.

If you create or update a role with the console, AWS Config attaches the **AWSServiceRoleForConfig** for you.

If you use the AWS CLI, use the `attach-role-policy` command and specify the Amazon Resource Name (ARN) for **AWSServiceRoleForConfig**:

```
$ aws iam attach-role-policy --role-name myConfigRole --policy-arn
 arn:aws:iam::aws:policy/aws-service-role/AWSServiceRoleForConfig
```

Managing Permissions for S3 Bucket Recording

AWS Config records and delivers notifications when an S3 bucket is created, updated, or deleted.

It is recommended to use the AWS Config service-linked role: `AWSServiceRoleForConfig`. Service-linked roles are predefined and include all the permissions that AWS Config requires to call other AWS services. The AWS Config service-linked role is required for service-linked configuration recorders. For more information, see Using Service-Linked Roles for AWS Config.

Updating the IAM Role for the customer managed configuration recorder

You can update the IAM role used by the customer managed configuration recorder. Before you update the IAM role, ensure that you have created a new role to replace the old one. You must attach policies to the new role that grant permissions to AWS Config to record configurations and deliver them to your delivery channel.

For information about creating an IAM role and attaching the required policies to the IAM role, see Step 3: Creating an IAM Role.

> **Note**
>
> To find the ARN of an existing IAM role, go to the IAM console at https://console.aws.amazon.com/iam/. Choose **Roles** in the navigation pane. Then choose the name of the desired role and find the ARN at the top of the **Summary** page.

Updating the IAM Role

You can update your IAM role using the AWS Management Console or the AWS CLI.

To update the IAM role (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Settings** in the navigation pane.
3. On the **Customer managed recorder** tab, choose **Edit** on the Settings page.
4. In the **Data governance**, section, choose the IAM role for AWS Config:
   - **Use an existing AWS Config service-linked role** – AWS Config creates a role that has the required permissions.
   - **Choose a role from your account** – For **Existing roles**, choose an IAM role in your account.
5. Choose **Save**.

To update the IAM role (AWS CLI)

Use the `put-configuration-recorder` command and specify the Amazon Resource Name (ARN) of the new role:

```
$ aws configservice put-configuration-recorder --configuration-recorder
 name=configRecorderName,roleARN=arn:aws:iam::012345678912:role/myConfigRole
```

Permissions for the Amazon S3 Bucket for the AWS Config Delivery Channel

> **Important**
>
> This page is about setting up the Amazon S3 Bucket for the AWS Config delivery channel. This page is not about the `AWS::S3::Bucket` resource type that the AWS Config configuration recorder can record.

Amazon S3 buckets and objects are private by default. Only the AWS account that created the bucket (the resource owner) has access permissions. Resource owners can grant access to other resources and users by creating access policies.

When AWS Config automatically creates an S3 bucket for you, it adds the required permissions. However, if you specify an existing S3 bucket, you must add these permissions manually.

Topics

- Required Permissions for the Amazon S3 Bucket When Using IAM Roles
- Required Permissions for the Amazon S3 Bucket When Using Service-Linked Roles
- Granting AWS Config access to the Amazon S3 Bucket
- Required Permissions for the Amazon S3 Bucket When Delivering Cross-Account

Required Permissions for the Amazon S3 Bucket When Using IAM Roles

AWS Config uses the IAM role you assigned to the configuration recorder to deliver configuration history and snapshots to S3 buckets in your account. For cross-account delivery, AWS Config first attempts to use the assigned IAM role. If the bucket policy doesn't grant `WRITE` access to the IAM role, AWS Config uses the `config.amazonaws.com` service principal. The bucket policy must grant `WRITE` access to `config.amazonaws.com` to complete the delivery. After successful delivery, AWS Config maintains ownership of all objects it delivers to the cross-account S3 bucket.

AWS Config calls the Amazon S3 HeadBucket API with the IAM role you assigned to the configuration recorder to confirm if the S3 bucket exists and its location. If you do not have the necessary permissions for AWS Config to confirm, you will see an `AccessDenied` error in your AWS CloudTrail logs. However, AWS Config can still deliver configuration history and snapshots

even if AWS Config does not have the necessary permissions to confirm if the S3 bucket exists and its location.

> **Minimum permissions**
>
> The Amazon S3 `HeadBucket` API requires the `s3:ListBucket` action.

Required Permissions for the Amazon S3 Bucket When Using Service-Linked Roles

The AWS Config service-linked role does not have permission to put objects to Amazon S3 buckets. If you set up AWS Config using a service-linked role, AWS Config will use the `config.amazonaws.com` service principal to deliver configuration history and snapshots. The S3 bucket policy in your account or cross-account destinations must include permissions for the AWS Config service principal to write objects.

Granting AWS Config access to the Amazon S3 Bucket

Complete the following steps enable AWS Config to deliver configuration history and snapshots to an Amazon S3 bucket.

1. Sign in to the AWS Management Console using the account that has the S3 bucket.
2. Open the Amazon S3 console at https://console.aws.amazon.com/s3/.
3. Select the bucket that you want AWS Config to use to deliver configuration items, and then choose **Properties**.
4. Choose **Permissions**.
5. Choose **Edit Bucket Policy**.
6. Copy the following policy into the **Bucket Policy Editor** window:

> **Security best practices**
>
> We strongly recommend that you restrict access in the bucket policy with the `AWS:SourceAccount` condition. This makes sure that AWS Config is granted access on behalf of expected users only.

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Sid": "AWSConfigBucketPermissionsCheck",
      "Effect": "Allow",
      "Principal": {
        "Service": "config.amazonaws.com"
      },
      "Action": "s3:GetBucketAcl",
      "Resource": "arn:aws:s3:::amzn-s3-demo-bucket",
      "Condition": {
        "StringEquals": {
          "AWS:SourceAccount": "sourceAccountID"
        }
      }
    },
    {
      "Sid": "AWSConfigBucketExistenceCheck",
      "Effect": "Allow",
      "Principal": {
        "Service": "config.amazonaws.com"
      },
      "Action": "s3:ListBucket",
      "Resource": "arn:aws:s3:::amzn-s3-demo-bucket",
      "Condition": {
        "StringEquals": {
          "AWS:SourceAccount": "sourceAccountID"
        }
      }
    },
    {
      "Sid": "AWSConfigBucketDelivery",
      "Effect": "Allow",
      "Principal": {
        "Service": "config.amazonaws.com"
      },
      "Action": "s3:PutObject",
```

```
      "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/[optional] prefix/
AWSLogs/sourceAccountID/Config/*",
      "Condition": {
        "StringEquals": {
          "s3:x-amz-acl": "bucket-owner-full-control",
          "AWS:SourceAccount": "sourceAccountID"
        }
      }
    }
  ]
}
```

7. Substitute the following values in the bucket policy:

   - *amzn-s3-demo-bucket* – Name of the Amazon S3 bucket where AWS Config will deliver configuration history and snapshots.
   - *[optional] prefix* – An optional addition to the Amazon S3 object key that helps create a folder-like organization in the bucket.
   - *sourceAccountID* – ID of the account where AWS Config will deliver configuration history and snapshots.
8. Choose **Save** and then **Close**.

The `AWS:SourceAccount` condition restricts AWS Config operations to specified AWS accounts. For multi-account configurations within an organization delivering to a single S3 bucket, use IAM roles with AWS Organizations conditions keys instead of service-linked roles. For example, `AWS:PrincipalOrgID`. For more information, see Managing access permissions for an organization in the *AWS Organizations User guide*.

The `AWS:SourceArn` condition restricts AWS Config operations to specified delivery channels. The `AWS:SourceArn` format is as follows: `arn:aws:config:`*sourceRegion*`:`*123456789012*.

For example, to restrict S3 bucket access to a delivery channel in the US East (N. Virginia) Region for account 123456789012, add the following condition:

```
"ArnLike": {"AWS:SourceArn": "arn:aws:config:us-east-1:123456789012:"}
```

Required Permissions for the Amazon S3 Bucket When Delivering Cross-Account

When AWS Config is configured to deliver configuration history and snapshots to an Amazon S3 bucket in a different account (cross-account setup), where the configuration recorder and the S3 bucket specified for delivery channel are in different AWS accounts, the following permissions are required:

- The IAM role you assign to the configuration recorder needs explicit permission to perform the `s3:ListBucket` operation. This is because AWS Config calls the Amazon S3 HeadBucket API with this IAM role to determine the bucket location.
- The S3 bucket policy must include permissions for the IAM role assigned to the configuration recorder.

The following is an example bucket policy configuration:

```
{
      "Sid": "AWSConfigBucketExistenceCheck",
      "Effect": "Allow",
      "Principal": {
        "AWS": "IAM Role-Arn assigned to the configuration recorder"
      },
      "Action": "s3:ListBucket",
      "Resource": "arn:aws:s3:::amzn-s3-demo-bucket",
}
```

Permissions for the KMS Key for the AWS Config Delivery Channel

Use the information in this topic if you want to create a policy for an AWS KMS key for your S3 bucket that allows you to use KMS-based encryption on objects delivered by AWS Config for S3 bucket delivery.

Contents

- Required Permissions for the KMS Key When Using IAM Roles (S3 Bucket Delivery)
- Required Permissions for the AWS KMS Key When Using Service-Linked Roles (S3 Bucket Delivery)
- Granting AWS Config access to the AWS KMS Key

Required Permissions for the KMS Key When Using IAM Roles (S3 Bucket Delivery)

If you set up AWS Config using an IAM role, you can attach the follow permission policy to the KMS Key:

```
{
    "Id": "Policy_ID",
    "Statement": [
        {
            "Sid": "AWSConfigKMSPolicy",
            "Action": [
                "kms:Decrypt",
                "kms:GenerateDataKey"
            ],
            "Effect": "Allow",
            "Resource": "*myKMSKeyARN*",
            "Principal": {
                "AWS": [
                    "account-id1",
                    "account-id2",
                    "account-id3"
                ]
            }
        }
    ]
}
```

> **Note**
>
> If the IAM role, Amazon S3 bucket policy, or AWS KMS key do not provide appropriate access to AWS Config, then AWS Config's attempt to send configuration information to the Amazon S3 bucket will fail. In this event, AWS Config sends the information again, this time as the AWS Config service principal. For this case, you must attach a permission policy, mentioned below, to the AWS KMS key to grant AWS Config access to use the key when delivering information to the Amazon S3 bucket.

Required Permissions for the AWS KMS Key When Using Service-Linked Roles (S3 Bucket Delivery)

The AWS Config service-linked role does not have permission to access the AWS KMS key. So, if you set up AWS Config using a service-linked role, AWS Config will send information as the AWS Config service principal instead. You will need to attach an access policy, mentioned below, to the AWS KMS key to grant AWS Config access to use the AWS KMS key when delivering information to the Amazon S3 bucket.

Granting AWS Config access to the AWS KMS Key

This policy allows AWS Config to use an AWS KMS key when delivering information to an Amazon S3 bucket

```
{
    "Id": "Policy_ID",
    "Statement": [
        {
            "Sid": "AWSConfigKMSPolicy",
            "Effect": "Allow",
            "Principal": {
                "Service": "config.amazonaws.com"
            },
            "Action": [
                "kms:Decrypt",
                "kms:GenerateDataKey"
            ],
            "Resource": "myKMSKeyARN",
            "Condition": {
                "StringEquals": {
                    "AWS:SourceAccount": "sourceAccountID"
                }
            }
        }
    ]
}
```

Substitute the following values in the key policy:

- *myKMSKeyARN* – The ARN of the AWS KMS key used to encrypt data in the Amazon S3 bucket that AWS Config will deliver configuration items to.

- *sourceAccountID* – The ID of the account for which AWS Config will deliver configuration items to.

You can use the `AWS:SourceAccount` condition in the AWS KMS key policy above to restrict the Config service principal to only interact with the AWS KMS key when performing operations on behalf of specific accounts.

AWS Config also supports the `AWS:SourceArn` condition which restricts the Config service principal to only interact with the Amazon S3 bucket when performing operations on behalf of specific AWS Config delivery channels. When using the AWS Config service principal, the `AWS:SourceArn` property will always be set to `arn:aws:config:sourceRegion:sourceAccountID:*` where `sourceRegion` is the region of the delivery channel and `sourceAccountID` is the ID of the account containing the delivery channel. For more information on AWS Config delivery channels, see Managing the Delivery Channel. For example, add the following condition to restrict the Config service principal to interact with your Amazon S3 bucket only on behalf of a delivery channel in the `us-east-1` region in the account `123456789012`: `"ArnLike": {"AWS:SourceArn": "arn:aws:config:us-east-1:123456789012:*"}`.

Permissions for the Amazon SNS Topic

> **Encrypted Amazon SNS not supported**
>
> AWS Config does not support encrypted Amazon SNS topics.

This topic describes how to configure AWS Config to deliver Amazon SNS topics owned by a different account. AWS Config must have the required permissions to send notifications to an Amazon SNS topic.

When the AWS Config console creates a new Amazon SNS topic for you, AWS Config grants the necessary permissions. If you choose an existing Amazon SNS topic, makes sure that the Amazon SNS topic includes the required permissions and follows security best practices.

Cross-Region Amazon SNS topics are not supported

AWS Config currently supports only access within the same AWS Region and across accounts.

Contents

- Required Permissions for the Amazon SNS Topic When Using IAM Roles
- Required Permissions for the Amazon SNS Topic When Using Service-Linked Roles
- Granting AWS Config access to the Amazon SNS topic
- Troubleshooting for the Amazon SNS Topic

Required Permissions for the Amazon SNS Topic When Using IAM Roles

You can attach a permissions policy to the Amazon SNS topic owned by a different account. If you want to use an Amazon SNS topic from another account, make sure to attach the following policy to the existing Amazon SNS topic.

```
{
  "Id": "Policy_ID",
  "Statement": [
    {
      "Sid": "AWSConfigSNSPolicy",
      "Action": [
        "sns:Publish"
      ],
      "Effect": "Allow",
      "Resource": "arn:aws:sns:region:account-id:myTopic",
      "Principal": {
        "AWS": [
          "account-id1",
          "account-id2",
          "account-id3"
        ]
      }
    }
  ]
}
```

For the `Resource` key, *`account-id`* is the AWS account number of the topic owner. For *`account-id1`*, *`account-id2`*, and *`account-id3`*, use the AWS accounts that will send data to an Amazon SNS topic. You can substitute appropriate values for *`region`* and *`myTopic`*.

When AWS Config sends a notification to an Amazon SNS topic, it first attempts to use the IAM role, but this attempt fails if the role or AWS account does not have permission to publish to the topic. In this event, AWS Config sends the notification again, this time as an AWS Config service principal name (SPN). Before the publication can succeed, the access policy for the topic must grant `sns:Publish` access to the `config.amazonaws.com` principal name. You must attach an access policy, described in the next section, to the Amazon SNS topic to grant AWS Config access to the Amazon SNS topic if the IAM role does not have permission to publish to the topic.

Required Permissions for the Amazon SNS Topic When Using Service-Linked Roles

The AWS Config service-linked role does not have permission to access the Amazon SNS topic. So, if you set up AWS Config using a service-linked role (SLR), AWS Config will send information as the AWS Config service principal instead. You will need to attach an access policy, mentioned below, to the Amazon SNS topic to grant AWS Config access to send information to the Amazon SNS topic.

For same-account setup, when the Amazon SNS topic and SLR are in the same account and the Amazon SNS policy grants the SLR "`sns:Publish`" permission, you do not need to use the AWS Config SPN. The permissions policy below and security best practice recommendations are for cross-account setup.

Granting AWS Config access to the Amazon SNS topic

This policy allows AWS Config to send a notification to an Amazon SNS topic. To grant AWS Config access to the Amazon SNS topic from another account, you will need to attach the following permissions policy.

> **Note**
>
> As a security best practice, it is strongly recommended to make sure AWS Config is accessing resources on behalf of expected users only by restricting access to the accounts listed in `AWS:SourceAccount` condition.

```
{
"Id": "Policy_ID",
```

```
"Statement": [
  {
    "Sid": "AWSConfigSNSPolicy",
    "Effect": "Allow",
    "Principal": {
      "Service": "config.amazonaws.com"
    },
    "Action": "sns:Publish",
      "Resource": "arn:aws:sns:region:account-id:myTopic",
        "Condition" : {
        "StringEquals": {
          "AWS:SourceAccount": [
            "account-id1",
            "account-id2",
            "account-id3"
          ]
        }
      }
    }
  ]
}
```

For the `Resource` key, *`account-id`* is the AWS account number of the topic owner. For *`account-id1`*, *`account-id2`*, and *`account-id3`*, use the AWS accounts that will send data to an Amazon SNS topic. You can substitute appropriate values for *`region`* and *`myTopic`*.

You can use the `AWS:SourceAccount` condition in the previous Amazon SNS topic policy to restrict the AWS Config service principal name (SPN) to interact only with the Amazon SNS topic when performing operations on behalf of specific accounts.

AWS Config also supports the `AWS:SourceArn` condition which restricts the AWS Config service principal name (SPN) to only interact with the S3 bucket when performing operations on behalf of specific AWS Config delivery channels. When using the AWS Config service principal name (SPN), the `AWS:SourceArn` property will always be set to `arn:aws:config:sourceRegion:sourceAccountID:*` where `sourceRegion` is the Region of the delivery channel and `sourceAccountID` is the ID of the account containing the delivery channel. For more information about AWS Config delivery channels, see Managing the Delivery Channel. For example, add the following condition to restrict the AWS Config service principal name (SPN) to interact with your S3 bucket only on behalf of a delivery channel in the `us-east-1` Region in the account `123456789012`: `"ArnLike": {"AWS:SourceArn": "arn:aws:config:us-east-1:123456789012:*"}`.

Troubleshooting for the Amazon SNS Topic

AWS Config must have permissions to send notifications to an Amazon SNS topic. If an Amazon SNS topic cannot receive notifications, verify that the IAM role that AWS Config was assuming has the required `sns:Publish` permissions.

Troubleshooting AWS Config identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with AWS Config and IAM.

Topics

- I am not authorized to perform an action in AWS Config
- I am not authorized to perform iam:PassRole
- I want to allow people outside of my AWS account to access my AWS Config resources

I am not authorized to perform an action in AWS Config

If you receive an error that you're not authorized to perform an action, your policies must be updated to allow you to perform the action.

The following example error occurs when the `mateojackson` IAM user tries to use the console to view details about a fictional *`my-example-widget`* resource but does not have the fictional `config:`*`GetWidget`* permissions.

```
User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform:
 config:GetWidget on resource: my-example-widget
```

In this case, Mateo's policy must be updated to allow him to access the *`my-example-widget`* resource using the `config:`*`GetWidget`* action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to AWS Config.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in AWS Config. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform:
 iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I want to allow people outside of my AWS account to access my AWS Config resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether AWS Config supports these features, see How AWS Config works with IAM.
- To learn how to provide access to your resources across AWS accounts that you own, see Providing access to an IAM user in another AWS account that you own in the *IAM User Guide*.
- To learn how to provide access to your resources to third-party AWS accounts, see Providing access to AWS accounts owned by third parties in the *IAM User Guide*.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the *IAM User Guide*.
- To learn the difference between using roles and resource-based policies for cross-account access, see Cross account resource access in IAM in the *IAM User Guide*.

Using Service-Linked Roles for AWS Config

AWS Config uses AWS Identity and Access Management (IAM) service-linked roles. A service-linked role is a unique type of IAM role that is linked directly to AWS Config. Service-linked roles are predefined by AWS Config and include all the permissions that the service requires to call other AWS services on your behalf.

A service-linked role makes setting up AWS Config easier because you don't have to manually add the necessary permissions. AWS Config defines the permissions of its service-linked roles, and unless defined otherwise, only AWS Config can assume its roles. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

For information about other services that support service-linked roles, see AWS Services That Work with IAM and look for the services that have **Yes** in the **Service-Linked Role** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

Service-Linked Role Permissions for AWS Config

AWS Config uses the service-linked role named **AwsServiceRoleForConfig** – AWS Config uses this service-linked role to call other AWS services on your behalf. To view the latest updates, see the section called "Policy updates".

The **AwsServiceRoleForConfig** service-linked role trusts the `config.amazonaws.com` service to assume the role.

The permissions policy for the `AwsServiceRoleForConfig` role contains read-only and write-only permissions for AWS Config resources and read-only permissions for resources in other services that AWS Config supports. To view the managed policy for **AwsServiceRoleForConfig**, see AWS managed policies for AWS Config.

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-Linked Role Permissions in the *IAM User Guide*.

To use a service-linked role with AWS Config, you must configure permissions on your Amazon S3 bucket and Amazon SNS topic. For more information, see Required Permissions for the Amazon S3 Bucket When Using Service-Linked Roles, Required Permissions for the AWS KMS Key When Using Service-Linked Roles (S3 Bucket Delivery), and Required Permissions for the Amazon SNS Topic When Using Service-Linked Roles.

Creating a Service-Linked Role for AWS Config

In the IAM CLI or the IAM API, create a service-linked role with the `config.amazonaws.com` service name. For more information, see Creating a Service-Linked Role in the *IAM User Guide*. If you delete this service-linked role, you can use this same process to create the role again.

Editing a Service-Linked Role for AWS Config

AWS Config does not allow you to edit the **AwsServiceRoleForConfig** service-linked role. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a Service-Linked Role in the *IAM User Guide*.

Deleting a Service-Linked Role for AWS Config

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don't have an unused entity that is not actively monitored or maintained. However, you must clean up the resources for your service-linked role before you can manually delete it.

> **Note**
>
> If the AWS Config service is using the role when you try to delete the resources, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

To delete AWS Config resources used by the AwsServiceRoleForConfig

Ensure that you do not have `ConfigurationRecorders` using the service-linked role. You can use the AWS Config console to stop the configuration recorder. To stop recording, under **Recording is on**, choose **Turn off**.

You can delete the `ConfigurationRecorder` using AWS Config API. To delete, use the `delete-configuration-recorder` command.

```
$ aws configservice delete-configuration-recorder --configuration-recorder-name default
```

To manually delete the service-linked role using IAM

Use the IAM console, the IAM CLI, or the IAM API to delete the AwsServiceRoleForConfig service-linked role. For more information, see Deleting a Service-Linked Role in the *IAM User Guide*.

Incident Response in AWS Config

Security is the highest priority at AWS. As part of the AWS Cloud shared responsibility model, AWS manages a data center, network, and software architecture that meets the requirements of the most security-sensitive organizations. AWS is responsible for any incident response with respect to the AWS Config service itself. Also, as an AWS customer, you share a responsibility for maintaining security in the cloud. This means you control the security you choose to implement from the AWS tools and features you have access to, and are responsible for incident response on your side of the shared responsibility model.

By establishing a security baseline that meets the objectives for your applications running in the cloud, you're able to detect deviations that you can respond to. Since security incident response can be a complex topic, we encourage you to review the following resources so that you are better able to understand the impact that incident response (IR) and your choices have on your corporate goals: AWS Security Incident Response Guide, AWS Security Best Practices whitepaper, and the Security Perspective of the AWS Cloud Adoption Framework (CAF) white paper.

Compliance Validation for AWS Config

Third-party auditors assess the security and compliance of AWS Config as part of multiple AWS compliance programs. These include SOC, PCI, FedRAMP, HIPAA, and others.

To learn whether an AWS service is within the scope of specific compliance programs, see AWS services in Scope by Compliance Program and choose the compliance program that you are interested in. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. For more information about your compliance responsibility when using AWS services, see AWS Security Documentation.

Resilience in AWS Config

The AWS global infrastructure is built around AWS Regions and Availability Zones. AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

Infrastructure Security in AWS Config

As a managed service, AWS Config is protected by AWS global network security. For information about AWS security services and how AWS protects infrastructure, see AWS Cloud Security. To design your AWS environment using the best practices for infrastructure security, see Infrastructure Protection in *Security Pillar AWS Well-Architected Framework*.

You use AWS published API calls to access AWS Config through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

Configuration and Vulnerability Analysis

For AWS Config, AWS handles basic security tasks such as guest operating system (OS) and database patching, firewall configuration, and disaster recovery.

Cross-service confused deputy prevention

The confused deputy problem is a security issue where an entity that doesn't have permission to perform an action can coerce a more-privileged entity to perform the action. In AWS, cross-service impersonation can result in the confused deputy problem. Cross-service impersonation can occur when one service (the *calling service*) calls another service (the *called service*). The calling service

can be manipulated to use its permissions to act on another customer's resources in a way it should not otherwise have permission to access. To prevent this, AWS provides tools that help you protect your data for all services with service principals that have been given access to resources in your account.

We recommend using the `aws:SourceArn` and `aws:SourceAccount` global condition context keys in resource policies to limit the permissions that AWS Config gives another service to the resource. Use `aws:SourceArn` if you want only one resource to be associated with the cross-service access. Use `aws:SourceAccount` if you want to allow any resource in that account to be associated with the cross-service use.

The most effective way to protect against the confused deputy problem is to use the `aws:SourceArn` global condition context key with the full ARN of the resource. If you don't know the full ARN of the resource or if you are specifying multiple resources, use the `aws:SourceArn` global context condition key with wildcard characters (*) for the unknown portions of the ARN. For example, `arn:aws:servicename:*:123456789012:*`.

If the `aws:SourceArn` value does not contain the account ID, such as an Amazon S3 bucket ARN, you must use both global condition context keys to limit permissions.

The following example shows how you can use the `aws:SourceArn` and `aws:SourceAccount` global condition context keys in AWS Config to prevent the confused deputy problem: Granting AWS Config access to the Amazon S3 Bucket.

Security Best Practices for AWS Config

AWS Config provides a number of security features to consider as you develop and implement your own security policies. The following best practices are general guidelines and don’t represent a complete security solution. Because these best practices might not be appropriate or sufficient for your environment, treat them as helpful considerations rather than prescriptions.

- Leverage tagging for AWS Config, which makes is easier to manage, search for, and filter resources.
- Confirm your delivery channels have been properly set, and once confirmed, verify that AWS Config is recording properly.

For more information, see AWS Config best practices blog.

Logging and Monitoring in AWS Config

AWS Config is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in AWS Config. Monitoring is an important part of maintaining the reliability, availability, and performance of AWS Config and your AWS solutions.

Topics

- Logging AWS Config API Calls with AWS CloudTrail
- Monitoring

Logging AWS Config API Calls with AWS CloudTrail

CloudTrail captures all API calls for AWS Config as events. The calls captured include calls from the AWS Config console and code calls to the AWS Config API operations. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for AWS Config. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in **Event history**. Using the information collected by CloudTrail, you can determine the request that was made to AWS Config, the IP address from which the request was made, who made the request, when it was made, and additional details.

To learn more about CloudTrail, see the AWS CloudTrail User Guide.

Topics

- AWS Config Information in CloudTrail
- Understanding AWS Config Log File Entries
- Example Log Files

AWS Config Information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in AWS Config, that activity is recorded in a CloudTrail event along with other AWS service events in **Event history**. You can view, search, and download recent events in your AWS account. For more information, see Viewing Events with CloudTrail Event History.

For an ongoing record of events in your AWS account, including events for AWS Config, create a trail. A *trail* enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you

create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- Overview for Creating a Trail
- CloudTrail Supported Services and Integrations
- Configuring Amazon SNS Notifications for CloudTrail
- Receiving CloudTrail Log Files from Multiple Regions and Receiving CloudTrail Log Files from Multiple Accounts

All AWS Config operations are logged by CloudTrail and are documented in the AWS Config API Reference. For example, calls to the DeliverConfigSnapshot, DeleteDeliveryChannel, and DescribeDeliveryChannels operations generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the CloudTrail userIdentity Element.

Understanding AWS Config Log File Entries

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files aren't an ordered stack trace of the public API calls, so they don't appear in any specific order.

Example Log Files

For examples of the CloudTrail log entries, see the following topics.

DeleteDeliveryChannel

The following is an example CloudTrail log file for the DeleteDeliveryChannel operation.

```
{
      "eventVersion": "1.02",
      "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE",
        "arn": "arn:aws:iam::222222222222:user/JohnDoe",
        "accountId": "222222222222",
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "userName": "JohnDoe"
      },
      "eventTime": "2014-12-11T18:32:57Z",
      "eventSource": "config.amazonaws.com",
      "eventName": "DeleteDeliveryChannel",
      "awsRegion": "us-west-2",
      "sourceIPAddress": "10.24.34.0",
      "userAgent": "aws-internal/3",
      "requestParameters": {
        "deliveryChannelName": "default"
      },
      "responseElements": null,
      "requestID": "207d695a-8164-11e4-ab4f-657c7ab282ab",
      "eventID": "5dcff7a9-e414-411a-a43e-88d122a0ad4a",
      "eventType": "AwsApiCall",
      "recipientAccountId": "222222222222"
    }
```

DeliverConfigSnapshot

The following is an example CloudTrail log file for the DeliverConfigSnapshot operation.

```
{
      "eventVersion": "1.02",
      "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AIDAABCDEFGHIJKLNMOPQ:Config-API-Test",
        "arn": "arn:aws:sts::111111111111:assumed-role/JaneDoe/Config-API-Test",
        "accountId": "111111111111",
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "sessionContext": {
```

```
          "attributes": {
            "mfaAuthenticated": "false",
            "creationDate": "2014-12-11T00:58:42Z"
          },
          "sessionIssuer": {
            "type": "Role",
            "principalId": "AIDAABCDEFGHIJKLNMOPQ",
            "arn": "arn:aws:iam::111111111111:role/JaneDoe",
            "accountId": "111111111111",
            "userName": "JaneDoe"
          }
        }
      },
      "eventTime": "2014-12-11T00:58:53Z",
      "eventSource": "config.amazonaws.com",
      "eventName": "DeliverConfigSnapshot",
      "awsRegion": "us-west-2",
      "sourceIPAddress": "10.24.34.0",
      "userAgent": "aws-cli/1.2.11 Python/2.7.4 Linux/2.6.18-164.el5",
      "requestParameters": {
        "deliveryChannelName": "default"
      },
      "responseElements": {
        "configSnapshotId": "58d50f10-212d-4fa4-842e-97c614da67ce"
      },
      "requestID": "e0248561-80d0-11e4-9f1c-7739d36a3df2",
      "eventID": "3e88076c-eae1-4aa6-8990-86fe52aedbd8",
      "eventType": "AwsApiCall",
      recipientAccountId": "111111111111"
    }
```

DescribeConfigurationRecorderStatus

The following is an example CloudTrail log file for the DescribeConfigurationRecorderStatus operation.

```
{
      "eventVersion": "1.02",
      "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE",
        "arn": "arn:aws:iam::222222222222:user/JohnDoe",
        "accountId": "222222222222",
```

```
        "accessKeyId": "AKIAI44QH8DHBEXAMPLE",
        "userName": "JohnDoe"
      },
      "eventTime": "2014-12-11T18:35:44Z",
      "eventSource": "config.amazonaws.com",
      "eventName": "DescribeConfigurationRecorderStatus",
      "awsRegion": "us-west-2",
      "sourceIPAddress": "192.0.2.0",
      "userAgent": "aws-cli/1.2.11 Python/2.7.4 Linux/2.6.18-164.el5",
      "requestParameters": null,
      "responseElements": null,
      "requestID": "8442f25d-8164-11e4-ab4f-657c7ab282ab",
      "eventID": "a675b36b-455f-4e18-a4bc-d3e01749d3f1",
      "eventType": "AwsApiCall",
      "recipientAccountId": "222222222222"
    }
```

DescribeConfigurationRecorders

The following is an example CloudTrail log file for the DescribeConfigurationRecorders operation.

```
{
      "eventVersion": "1.02",
      "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE",
        "arn": "arn:aws:iam::222222222222:user/JohnDoe",
        "accountId": "222222222222",
        "accessKeyId": "AKIAI44QH8DHBEXAMPLE",
        "userName": "JohnDoe"
      },
      "eventTime": "2014-12-11T18:34:52Z",
      "eventSource": "config.amazonaws.com",
      "eventName": "DescribeConfigurationRecorders",
      "awsRegion": "us-west-2",
      "sourceIPAddress": "192.0.2.0",
      "userAgent": "aws-cli/1.2.11 Python/2.7.4 Linux/2.6.18-164.el5",
      "requestParameters": null,
      "responseElements": null,
      "requestID": "6566b55c-8164-11e4-ab4f-657c7ab282ab",
      "eventID": "6259a9ad-889e-423b-beeb-6e1eec84a8b5",
      "eventType": "AwsApiCall",
```

```
      "recipientAccountId": "222222222222"
    }
```

DescribeDeliveryChannels

Following is an example CloudTrail log file for the DescribeDeliveryChannels operation.

```
{
      "eventVersion": "1.02",
      "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE",
        "arn": "arn:aws:iam::222222222222:user/JohnDoe",
        "accountId": "222222222222",
        "accessKeyId": "AKIAI44QH8DHBEXAMPLE",
        "userName": "JohnDoe"
      },
      "eventTime": "2014-12-11T18:35:02Z",
      "eventSource": "config.amazonaws.com",
      "eventName": "DescribeDeliveryChannels",
      "awsRegion": "us-west-2",
      "sourceIPAddress": "192.0.2.0",
      "userAgent": "aws-cli/1.2.11 Python/2.7.4 Linux/2.6.18-164.el5",
      "requestParameters": null,
      "responseElements": null,
      "requestID": "6b6aee3f-8164-11e4-ab4f-657c7ab282ab",
      "eventID": "3e15ebc5-bf39-4d2a-8b64-9392807985f1",
      "eventType": "AwsApiCall",
      "recipientAccountId": "222222222222"
    }
```

GetResourceConfigHistory

The following is an example CloudTrail log file for the GetResourceConfigHistory operation.

```
{
      "eventVersion": "1.02",
      "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AIDAABCDEFGHIJKLNMOPQ:Config-API-Test",
        "arn": "arn:aws:sts::111111111111:assumed-role/JaneDoe/Config-API-Test",
        "accountId": "111111111111",
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
```

```
        "sessionContext": {
          "attributes": {
            "mfaAuthenticated": "false",
            "creationDate": "2014-12-11T00:58:42Z"
          },
          "sessionIssuer": {
            "type": "Role",
            "principalId": "AIDAABCDEFGHIJKLNMOPQ",
            "arn": "arn:aws:iam::111111111111:role/JaneDoe",
            "accountId": "111111111111",
            "userName": "JaneDoe"
          }
        }
      },
      "eventTime": "2014-12-11T00:58:42Z",
      "eventSource": "config.amazonaws.com",
      "eventName": "GetResourceConfigHistory",
      "awsRegion": "us-west-2",
      "sourceIPAddress": "10.24.34.0",
      "userAgent": "aws-cli/1.2.11 Python/2.7.4 Linux/2.6.18-164.el5",
      "requestParameters": {
        "resourceId": "vpc-a12bc345",
        "resourceType": "AWS::EC2::VPC",
        "limit": 0,
        "laterTime": "Dec 11, 2014 12:58:42 AM",
        "earlierTime": "Dec 10, 2014 4:58:42 PM"
      },
      "responseElements": null,
      "requestID": "d9f3490d-80d0-11e4-9f1c-7739d36a3df2",
      "eventID": "ba9c1766-d28f-40e3-b4c6-3ffb87dd6166",
      "eventType": "AwsApiCall",
      "recipientAccountId": "111111111111"
      }
```

PutConfigurationRecorder

The following is an example CloudTrail log file for the PutConfigurationRecorder operation.

```
{
      "eventVersion": "1.02",
      "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE",
        "arn": "arn:aws:iam::222222222222:user/JohnDoe",
```

```
        "accountId": "222222222222",
        "accessKeyId": "AKIAI44QH8DHBEXAMPLE",
        "userName": "JohnDoe"
      },
      "eventTime": "2014-12-11T18:35:23Z",
      "eventSource": "config.amazonaws.com",
      "eventName": "PutConfigurationRecorder",
      "awsRegion": "us-west-2",
      "sourceIPAddress": "192.0.2.0",
      "userAgent": "aws-cli/1.2.11 Python/2.7.4 Linux/2.6.18-164.el5",
      "requestParameters": {
        "configurationRecorder": {
          "name": "default",
          "roleARN": "arn:aws:iam::222222222222:role/config-role-pdx"
        }
      },
      "responseElements": null,
      "requestID": "779f7917-8164-11e4-ab4f-657c7ab282ab",
      "eventID": "c91f3daa-96e8-44ee-8ddd-146ac06565a7",
      "eventType": "AwsApiCall",
      "recipientAccountId": "222222222222"
    }
```

PutDeliveryChannel

The following is an example CloudTrail log file for the PutDeliveryChannel operation.

```
{
      "eventVersion": "1.02",
      "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE",
        "arn": "arn:aws:iam::222222222222:user/JohnDoe",
        "accountId": "222222222222",
        "accessKeyId": "AKIAI44QH8DHBEXAMPLE",
        "userName": "JohnDoe"
      },
      "eventTime": "2014-12-11T18:33:08Z",
      "eventSource": "config.amazonaws.com",
      "eventName": "PutDeliveryChannel",
      "awsRegion": "us-west-2",
      "sourceIPAddress": "192.0.2.0",
      "userAgent": "aws-cli/1.2.11 Python/2.7.4 Linux/2.6.18-164.el5",
      "requestParameters": {
```

```
        "deliveryChannel": {
          "name": "default",
          "s3BucketName": "config-api-test-pdx",
          "snsTopicARN": "arn:aws:sns:us-west-2:222222222222:config-api-test-pdx"
        }
      },
      "responseElements": null,
      "requestID": "268b8d4d-8164-11e4-ab4f-657c7ab282ab",
      "eventID": "b2db05f1-1c73-4e52-b238-db69c04e8dd4",
      "eventType": "AwsApiCall",
      "recipientAccountId": "222222222222"
    }
```

StartConfigurationRecorder

The following is an example CloudTrail log file for the StartConfigurationRecorder operation.

```
{
      "eventVersion": "1.02",
      "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE",
        "arn": "arn:aws:iam::222222222222:user/JohnDoe",
        "accountId": "222222222222",
        "accessKeyId": "AKIAI44QH8DHBEXAMPLE",
        "userName": "JohnDoe"
      },
      "eventTime": "2014-12-11T18:35:34Z",
      "eventSource": "config.amazonaws.com",
      "eventName": "StartConfigurationRecorder",
      "awsRegion": "us-west-2",
      "sourceIPAddress": "192.0.2.0",
      "userAgent": "aws-cli/1.2.11 Python/2.7.4 Linux/2.6.18-164.el5",
      "requestParameters": {
        "configurationRecorderName": "default"
      },
      "responseElements": null,
      "requestID": "7e03fa6a-8164-11e4-ab4f-657c7ab282ab",
      "eventID": "55a5507f-f306-4896-afe3-196dc078a88d",
      "eventType": "AwsApiCall",
      "recipientAccountId": "222222222222"
    }
```

StopConfigurationRecorder

The following is an example CloudTrail log file for the StopConfigurationRecorder operation.

```
{
      "eventVersion": "1.02",
      "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE",
        "arn": "arn:aws:iam::222222222222:user/JohnDoe",
        "accountId": "222222222222",
        "accessKeyId": "AKIAI44QH8DHBEXAMPLE",
        "userName": "JohnDoe"
      },
      "eventTime": "2014-12-11T18:35:13Z",
      "eventSource": "config.amazonaws.com",
      "eventName": "StopConfigurationRecorder",
      "awsRegion": "us-west-2",
      "sourceIPAddress": "192.0.2.0",
      "userAgent": "aws-cli/1.2.11 Python/2.7.4 Linux/2.6.18-164.el5",
      "requestParameters": {
        "configurationRecorderName": "default"
      },
      "responseElements": null,
      "requestID": "716deea3-8164-11e4-ab4f-657c7ab282ab",
      "eventID": "6225a85d-1e49-41e9-bf43-3cfc5549e560",
      "eventType": "AwsApiCall",
      "recipientAccountId": "222222222222"
    }
```

Monitoring

You can use other AWS services to monitor AWS Config resources.

- You can use Amazon Simple Notification Service (SNS) to send you notifications every time a supported AWS resource is created, updated, or otherwise modified as a result of user API activity.
- You can use Amazon EventBridge to detect and react to changes in the status of AWS Config events.

Topics

- Monitoring AWS Resource Changes with Amazon SQS
- Monitoring AWS Config with Amazon EventBridge

Monitoring AWS Resource Changes with Amazon SQS

AWS Config uses Amazon Simple Notification Service (SNS) to send you notifications every time a supported AWS resource is created, updated, or otherwise modified as a result of user API activity. However, you might be interested in only certain resource configuration changes. For example, you might consider it critical to know when someone modifies the configuration of a security group, but not need to know every time there is a change to tags on your Amazon EC2 instances. Or, you might want to write a program that performs specific actions when specific resources are updated. For example, you might want to start a certain workflow when a security group configuration is changed. If you want to programmatically consume the data from AWS Config in these or other ways, use an Amazon Simple Queue Service queue as the notification endpoint for Amazon SNS.

> **Note**
>
> Notifications can also come from Amazon SNS in the form of an email, a Short Message Service (SMS) message to SMS-enabled mobile phones and smartphones, a notification message to an application on a mobile device, or a notification message to one or more HTTP or HTTPS endpoints.

You can have a single SQS queue subscribe to multiple topics, whether you have one topic for each region or one topic for each account for each region. You must subscribe the queue to your desired SNS topic. (You can subscribe multiple queues to one SNS topic.) For more information, see Sending Amazon SNS Messages to Amazon SQS Queues.

Permissions for Amazon SQS

To use Amazon SQS with AWS Config, you must configure a policy that grants permissions to your account to perform all actions that are allowed on an SQS queue. The following example policy grants the account number 111122223333 and account number 444455556666 permission to send messages pertaining to each configuration change to the queue named arn:aws:sqs:us-east-2:444455556666:queue1.

JSON

```
{
  "Version":"2012-10-17",
  "Id": "Queue1_Policy_UUID",
  "Statement":
    {
       "Sid":"Queue1_SendMessage",
       "Effect": "Allow",
       "Principal": {
            "AWS": ["111122223333","444455556666"]
         },
        "Action": "sqs:SendMessage",
        "Resource": "arn:aws:sqs:us-east-2:444455556666:queue1"
     }
}
```

You must also create a policy that grants permissions for connections between an SNS topic and the SQS queue that subscribes to that topic. The following is an example policy that permits the SNS topic with the Amazon Resource Name (ARN) arn:aws:sns:us-east-2:111122223333:test-topic to perform any actions on the queue named arn:aws:sqs:us-east-2:111122223333:test-topic-queue.

> **Note**
>
> The account for the SNS topic and the SQS queue must be in the same region.

JSON

```
{
  "Version":"2012-10-17",
  "Id": "SNStoSQS",
  "Statement":
    {
      "Sid":"rule1",
      "Effect": "Allow",
      "Principal": {
```

```
        "Service": "sns.amazonaws.com"
      },
      "Action": "SQS:SendMessage",
      "Resource": "arn:aws:sqs:us-east-2:111122223333:test-topic-queue",
      "Condition" : {
        "StringEquals" : {
          "aws:SourceArn":"arn:aws:sns:us-east-2:111122223333:test-topic"
        }
      }
    }
}
```

Each policy can include statements that cover only a single queue, not multiple queues. For information about other restrictions on Amazon SQS policies, see Special Information for Amazon SQS Policies.

Monitoring AWS Config with Amazon EventBridge

Amazon EventBridge delivers a near real-time stream of system events that describe changes in AWS resources. Use Amazon EventBridge to detect and react to changes in the status of AWS Config events.

You can create a rule that runs whenever there is a state transition, or when there is a transition to one or more states that are of interest. Then, based on rules you create, Amazon EventBridge invokes one or more target actions when an event matches the values you specify in a rule. Depending on the type of event, you might want to send notifications, capture event information, take corrective action, initiate events, or take other actions.

Before you create event rules for AWS Config, however, you should do the following:

- Familiarize yourself with events, rules, and targets in EventBridge. For more information, see What Is Amazon EventBridge?
- For more information about how to get started with EventBridge and set up rules, see Getting started with Amazon EventBridge.
- Create the target or targets you will use in your event rules.

Topics

- Considerations

- Amazon EventBridge format for AWS Config
- Creating Amazon EventBridge Rule for AWS Config

Considerations

You will not receive alerts through EventBridge for the following resource types if you are not recording them with AWS Config:

- `AWS::ACM::Certificate`
- `AWS::CloudTrail::Trail`
- `AWS::CloudWatch::Alarm`
- `AWS::EC2::CustomerGateway`
- `AWS::EC2::EIP`
- `AWS::EC2::Host`
- `AWS::EC2::Instance`
- `AWS::EC2::InternetGateway`
- `AWS::EC2::NetworkAcl`
- `AWS::EC2::NetworkInterface`
- `AWS::EC2::RouteTable`
- `AWS::EC2::SecurityGroup`
- `AWS::EC2::Subnet`
- `AWS::EC2::VPC`
- `AWS::EC2::VPNConnection`
- `AWS::EC2::VPNGateway`
- `AWS::EC2::Volume`
- `AWS::ElasticLoadBalancingV2::LoadBalancer`
- `AWS::IAM::Group`
- `AWS::IAM::Policy`
- `AWS::IAM::Role`
- `AWS::IAM::User`
- `AWS::RDS::DBInstance`
- `AWS::RDS::DBSecurityGroup`

- AWS::RDS::DBSnapshot
- AWS::RDS::DBSubnetGroup
- AWS::RDS::EventSubscription
- AWS::Redshift::Cluster
- AWS::Redshift::ClusterParameterGroup
- AWS::Redshift::ClusterSecurityGroup
- AWS::Redshift::ClusterSnapshot
- AWS::Redshift::ClusterSubnetGroup
- AWS::Redshift::EventSubscription
- AWS::S3::Bucket

Amazon EventBridge format for AWS Config

The EventBridge event for AWS Config has the following format:

```
{
   "version": "0",
   "id": "cd4d811e-ab12-322b-8255-872ce65b1bc8",
   "detail-type": "event type",
   "source": "aws.config",
   "account": "111122223333",
   "time": "2018-03-22T00:38:11Z",
   "region": "us-east-1",
   "resources": [
      resources
   ],
   "detail": {
      specific message type
   }
}
```

Creating Amazon EventBridge Rule for AWS Config

Use the following steps to create an EventBridge rule that triggers on an event emitted by AWS Config. Events are emitted on a best effort basis.

1. In the navigation pane, choose **Rules**.
2. Choose **Create rule**.
3. Enter a name and description for the rule.

   A rule can't have the same name as another rule in the same Region and on the same event bus.

   > **Note**
   >
   > An event bus receives events from a source, uses rules to evaluate them, applies any configured input transformation, and routes them to the appropriate target(s). Your account's default event bus receives events from AWS services. A custom event bus can receive events from your custom applications and services. A partner event bus receives events from an event source created by an SaaS partner. These events come from the partners services or applications. For more information, see Event buses in Amazon EventBridge in the *Amazon EventBridge User Guide*.

4. For **Rule type**, choose **Rule with an event pattern**.
5. For **Event source**, choose **AWS events or EventBridge partner events**.
6. (Optional) For **Sample event type**, choose **AWS events**.
7. (Optional) For **Sample events**, choose the event type that triggers the rule:
   - Choose **AWS API Call from CloudTrail** to base rules on API calls made to this service. For more information about creating this type of rule, see Tutorial: Create an Amazon EventBridge rule for AWS CloudTrail API calls.
   - Choose **Config Configuration Item Change** to get notifications when a resource in your account changes.

     As described in these support articles, you can use EventBridge to receive custom email notifications when a resource is created or deleted, How can I receive custom email notifications when a resource is created in my AWS account using AWS Config service? and How can I receive custom email notifications when a resource is deleted in my AWS account using AWS Config service?.
   - Choose **Config Rules Compliance Change** to get notifications when a compliance check to your rules fails.

As described in this support article, you can use EventBridge to receive custom email notifications when a resource is noncompliant, How can I be notified when an AWS resource is noncompliant using AWS Config?.

- Choose **Config Rules Re-evaluation Status** to get reevaluation status notifications.
- Choose **Config Configuration Snapshot Delivery Status** to get configuration snapshot delivery status notifications.
- Choose **Config Configuration History Delivery Status** to get configuration history delivery status notifications.

8. For **Creation method**, choose **Use pattern form**.
9. For **Event source**, choose **AWS services**.
10. For **AWS service**, choose **Config**.
11. For **Event type**, choose the event type that triggers the rule:

- Choose **All Events** to make a rule that applies to all AWS services. If you choose this option, you cannot choose specific message types, rule names, resource types, or resource IDs.
- Choose **AWS API Call from CloudTrail** to base rules on API calls made to this service. For more information about creating this type of rule, see Tutorial: Create an Amazon EventBridge rule for AWS CloudTrail API calls.
- Choose **Config Configuration Item Change** to get notifications when a resource in your account changes.

  As described in these support articles, you can use EventBridge to receive custom email notifications when a resource is created or deleted, How can I receive custom email notifications when a resource is created in my AWS account using AWS Config service? and How can I receive custom email notifications when a resource is deleted in my AWS account using AWS Config service?.
- Choose **Config Rules Compliance Change** to get notifications when a compliance check to your rules fails.

  As described in this support article, you can use EventBridge to receive custom email notifications when a resource is noncompliant, How can I be notified when an AWS resource is noncompliant using AWS Config?.
- Choose **Config Rules Re-evaluation Status** to get reevaluation status notifications.
- Choose **Config Configuration Snapshot Delivery Status** to get configuration snapshot delivery status notifications.

- Choose **Config Configuration History Delivery Status** to get configuration history delivery status notifications.

12. Choose **Any message type** to receive notifications of any type. Choose **Specific message type(s)** to receive the following types of notifications:
    - If you choose **ConfigurationItemChangeNotification**, you receive messages when the configuration of a resource that AWS Config evaluates has changed.
    - If you choose **ComplianceChangeNotification**, you receive messages when the compliance type of a resource that AWS Config evaluates has changed.
    - If you choose **ConfigRulesEvaluationStarted**, you receive messages when AWS Config starts evaluating your rule against the specified resources.
    - If you choose **ConfigurationSnapshotDeliveryCompleted**, you receive messages when AWS Config successfully delivers the configuration snapshot to your Amazon S3 bucket.
    - If you choose **ConfigurationSnapshotDeliveryFailed**, you receive messages when AWS Config fails to deliver the configuration snapshot to your Amazon S3 bucket.
    - If you choose **ConfigurationSnapshotDeliveryStarted**, you receive messages when AWS Config starts delivering the configuration snapshot to your Amazon S3 bucket.
    - If you choose **ConfigurationHistoryDeliveryCompleted**, you receive messages when AWS Config successfully delivers the configuration history to your Amazon S3 bucket.
13. If you chose a specific event type from the **Event Type** dropdown list, choose **Any resource type** to make a rule that applies to all AWS Config supported resource types.

    Or choose **Specific resource type(s)**, and then type the AWS Config supported resource type (for example, `AWS::EC2::Instance`).
14. If you chose a specific event type from the **Event Type** dropdown list, choose **Any resource ID** to include any AWS Config supported resource ID.

    Or choose **Specific resource ID(s)**, and then type the AWS Config supported resource ID (for example, `i-04606de676e635647`).
15. If you chose a specific event type from the **Event Type** dropdown list, choose **Any rule name** to include any AWS Config supported rule.

    Or choose **Specific rule name(s)**, and then type the AWS Config supported rule (for example, **required-tags**).
16. For **Select target(s)**, choose the type of target you have prepared to use with this rule, and then configure any additional options required by that type.

17. The fields displayed vary depending on the service you choose. Enter information specific to this target type as needed.
18. For many target types, EventBridge needs permissions to send events to the target. In these cases, EventBridge can create the IAM role needed for your rule to run.
    - To create an IAM role automatically, choose **Create a new role for this specific resource**.
    - To use an IAM role that you created earlier, choose **Use existing role**.
19. (Optional) Choose **Add target** to add another target for this rule.
20. (Optional) Enter one or more tags for the rule. For more information, see Amazon EventBridge tags.
21. Review your rule setup to make sure it meets your event-monitoring requirements.
22. Choose **Create** to confirm your selection.

Using AWS Config with Interface Amazon VPC Endpoints

If you use Amazon Virtual Private Cloud (Amazon VPC) to host your AWS resources, you can establish a private connection between your VPC and AWS Config. You can use this connection to communicate with AWS Config from your VPC without going through the public internet.

Amazon VPC is an AWS service that you can use to launch AWS resources in a virtual network that you define. With a VPC, you have control over your network settings, such the IP address range, subnets, route tables, and network gateways. Interface VPC endpoints are powered by AWS PrivateLink, an AWS technology that enables private communication between AWS services using an elastic network interface with private IP addresses. To connect your VPC to AWS Config, you define an *interface VPC endpoint* for AWS Config. This type of endpoint enables you to connect your VPC to AWS services. The endpoint provides reliable, scalable connectivity to AWS Config without requiring an internet gateway, network address translation (NAT) instance, or VPN connection. For more information, see What is Amazon VPC in the *Amazon VPC User Guide*.

The following steps are for users of Amazon VPC. For more information, see Getting Started in the *Amazon VPC User Guide*.

Create a VPC Endpoint for AWS Config

To start using AWS Config with your VPC, create an interface VPC endpoint for AWS Config. You do not need to change the settings for AWS Config. AWS Config calls other AWS services using their public endpoints. For more information, see Creating an Interface Endpoint in the *Amazon VPC User Guide*.

Frequently Asked Questions

Unable to see my latest configuration changes

Can I expect to view my configuration changes right away?

AWS Config usually records configuration changes to your resources right after a change is detected, or at the frequency that you specify. However, this is on a best effort basis and can take longer at times. If issues persist after sometime, contact Support and provide your AWS Config metrics that are supported by Amazon CloudWatch. For information about these metrics, see AWS Config Usage and Success Metrics.

Indirect Relationships in AWS Config

Topics

- What is resource relationship?
- What is a direct and an indirect relationship with respect to a resource?
- Which indirect relationships does AWS Config support?
- Which scenarios uses indirect relationship?
- How are the configuration items created due to direct and indirect relationship?
- What are the configuration items generated due to indirect relationships?
- How do I disable indirect relationship?
- How do I retrieve configuration data related to indirect relationships?

What is resource relationship?

In AWS, resources refer to entities that are manageable, such as an Amazon Elastic Compute Cloud (Amazon EC2) instance, an AWS CloudFormation stack, or an Amazon S3 bucket. AWS Config is a service that tracks and monitors resources by creating configuration items (CIs) whenever a change to a recorded resource type is detected, or at the recording frequency that you set. For instance, when AWS Config is set up to track Amazon EC2 instances, it creates a configuration item every time an instance is created, updated, or deleted. Each configuration item created by AWS Config has several fields, including `accountId`, `arn` (Amazon Resource Name), `awsRegion`, `configuration`, `tags`, and `relationships`. The relationships field of a CI enables AWS Config

to display how resources are linked to one another. For instance, a relationship may indicate that an Amazon EBS volume with ID `vol-123ab45d` is attached to an Amazon EC2 instance with ID `i-a1b2c3d4`, which is associated with security group `sg-ef678hk`.

What is a direct and an indirect relationship with respect to a resource?

AWS Config derives the relationships for most resource types from the configuration field, which are called "direct" relationships. A direct relationship is a one-way connection (A→B) between a resource (A) and another resource (B), typically obtained from the describe API response of resource (A). In the past, for some resource types that AWS Config initially supported, it also captured relationships from the configurations of other resources, creating "indirect" relationships that are bidirectional (B→A). For example, the relationship between an Amazon EC2 instance and its security group is direct because the security groups are included in the describe API response for the Amazon EC2 instance. On the other hand, the relationship between a security group and an Amazon EC2 instance is indirect because describing a security group does not return any information about the instances it is associated with.

For example, indirect relationships can help answer the following questions:

- When a NAT Gateway fails, which EC2 instances in private subnets are affected?
- If a route table is modified, which EC2 instance might experience connectivity issues?
- Which security group was never used?
- Which secondary ENI attached to an EC2 instance is associated with the security group?

As a result, when a resource configuration change is detected, AWS Config not only creates a CI for that resource, but also generates CIs for any related resources, including those with indirect relationships. For example, when AWS Config detects changes in an Amazon EC2 instance, it creates a CI for the instance and a CI for the security group that is associated with the instance.

Which indirect relationships does AWS Config support?

The following indirect resource relationships are supported in AWS Config.

Resource type	is indirectly related to the resource type		
`AWS::EC2::RouteTable`	`AWS::EC2::Instance`		

Resource type	is indirectly related to the resource type		
	, AWS::EC2::NetworkInterface , AWS::EC2::Subnet , AWS::EC2::VPNGateway , AWS::EC2::VPC		
AWS::EC2::EIP	AWS::EC2::Instance , AWS::EC2::NetworkInterface		
AWS::EC2::Instance	AWS::EC2::SecurityGroup , AWS::EC2::Subnet , AWS::EC2::VPC		
AWS::EC2::NetworkInterface	AWS::EC2::SecurityGroup , AWS::EC2::Subnet , AWS::EC2::VPC		
AWS::EC2::NetworkACL	AWS::EC2::Subnet , AWS::EC2::VPC		

Resource type	is indirectly related to the resource type		
AWS::EC2::VPNConnection	AWS::EC2::VPNGateway ,AWS::EC2::CustomerGateway		
AWS::EC2::InternetGateway	AWS::EC2::VPC		
AWS::EC2::SecurityGroup	AWS::EC2::VPC		
AWS::EC2::Subnet	AWS::EC2::VPC		
AWS::EC2::VPNGateway	AWS::EC2::VPC		

Which scenarios uses indirect relationship?

Below are the AWS services and the service's feature using indirect relationship.

AWS feature	Scenario
AWS Config managed rule	ec2-security-group-attached-to-eni rule checks whether non-default security groups are attached to Elastic Network Interfaces (ENI). Without an indirect relationship, you would need to create a custom rule to check if non-default security groups are attached to an ENI.

AWS feature	Scenario
AWS Firewall Manager	Usage Audit Security Group policy uses indirect relationship to understand when a security group was last used. Without an indirect relationship, you would need to build and associate a security group to new resources at the same time to avoid triggering the rule with AWS Firewall Manager.

Default resources	• Default resources when a non-default VPC is created:
	  • Default security group, default network ACL, and default route table.
	• Default resources when a default VPC is created:
	  • Everything that is created with non-defau lt VPC, an internet gateway, and default subnet in each Availability Zone that you have access to.
	• Default VPC creation itself when an account calls EC2 for first time ever.
	  • Default subnet created for accounts in a newly launched Availability Zone.
	
	Without an indirect relationship, you would need to wait up to 12 hours for automatic baselining to record changes to default resources.

How are the configuration items created due to direct and indirect relationship?

For a direct relationship between resources (A→B), any configuration change to the resource B will initiate a configuration item (CI) for the resource A as well. Similarly, for an indirect relationship (B→A), when there is a configuration change to resource A a new CI will be generated for resource B. For example, Amazon EC2 instance to security group is a direct relationship so any configuration change to a security group would generate a CI for the security group as well as a CI for the EC2 instance. Similarly, security group to Amazon EC2 instance is an indirect relationship so any configuration change to an EC2 instance would generate a CI for the Amazon EC2 instance as well as a CI for the security group.

What are the configuration items generated due to indirect relationships?

Below are the additional configuration items (CIs) generated due to indirect resource relationships.

Configuration changes to the following resource types	will generate CIs for the following resources types		
`AWS::EC2::RouteTable`	`AWS::EC2::Instance` , `AWS::EC2::NetworkInterface` , `AWS::EC2::Subnet` , `AWS::EC2::VPNGateway` , and `AWS::EC2::VPC`		
`AWS::EC2::EIP`	`AWS::EC2::Instance` , `AWS::EC2:`		

Configuration changes to the following resource types	will generate CIs for the following resources types		
	:NetworkInterface		
AWS::EC2::Instance	AWS::EC2::Security Group ,AWS::EC2::Subnet , AWS::EC2::VPC		
AWS::EC2::NetworkInterface	AWS::EC2::Security Group , AWS::EC2::Subnet , AWS::EC2::VPC		
AWS::EC2::NetworkACL	AWS::EC2::Subnet , AWS::EC2::VPC		
AWS::EC2::VPNConnection	AWS::EC2::VPNGateway ,AWS::EC2::Customer Gateway		
AWS::EC2::Internet Gateway	AWS::EC2::VPC		
AWS::EC2::SecurityGroup	AWS::EC2::VPC		

Configuration changes to the following resource types	will generate CIs for the following resources types		
`AWS::EC2::Subnet`	`AWS::EC2::VPC`		
`AWS::EC2::VPNGateway`	`AWS::EC2::VPC`		

How do I disable indirect relationship?

Complete the following steps to disable indirect relationship:

1. Open an AWS Support case from your account or from the management account for multiple accounts.
2. Select **Technical** for the support type.
3. For Service, select **AWS Config**.
4. For Category, select **Other**.
5. Select appropriate severity level.
6. Enter **Disable Indirect Relationship** in the subject line.
7. In the description:
   - Confirm you have read this FAQ and want to proceed.
   - List the regions where you want to disable indirect relationship.
   - If submitting from a management account, include account IDs and their associated regions.
   - For multiple accounts, you may attach a CSV file with account IDs and regions.

An AWS Support engineer will provide next steps and status updates. We recommend that you maintain a list of AWS accounts and regions where indirect relationship is disabled. For new accounts, submit a new AWS Support case to disable indirect relationship.

How do I retrieve configuration data related to indirect relationships?

You can run Structured Query Language (SQL) queries in AWS Config Advanced Queries to retrieve configuration data related to indirect resource relationships. For example, if you want to retrieve the list of Amazon EC2 instances related to a security group, use the following query:

```
SELECT
    resourceId,
    resourceType
    WHERE
    resourceType ='AWS::EC2::Instance'
    AND
    relationships.resourceId = 'sg-234213'
```

Code examples for AWS Config using AWS SDKs

The following code examples show how to use AWS Config with an AWS software development kit (SDK).

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

  - Use DescribeDeliveryChannels with a CLI
  - Use GetComplianceDetailsByConfigRule with a CLI
  - Use GetComplianceDetailsByResource with a CLI
  - Use GetComplianceSummaryByConfigRule with a CLI
  - Use GetComplianceSummaryByResourceType with a CLI
  - Use PutConfigRule with an AWS SDK or CLI
  - Use PutDeliveryChannel with a CLI

Actions for AWS Config using AWS SDKs

The following code examples demonstrate how to perform individual AWS Config actions with AWS SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

These excerpts call the AWS Config API and are code excerpts from larger programs that must be run in context. You can see actions in context in Scenarios for AWS Config using AWS SDKs.

The following examples include only the most commonly used actions. For a complete list, see the AWS Config API Reference.

Examples

- Use DeleteConfigRule with an AWS SDK or CLI

- Use DescribeComplianceByConfigRule with a CLI
- Use DescribeComplianceByResource with a CLI
- Use DescribeConfigRuleEvaluationStatus with a CLI
- Use DescribeConfigRules with an AWS SDK or CLI
- Use DescribeConfigurationRecorderStatus with a CLI
- Use DescribeConfigurationRecorders with a CLI
- Use DescribeDeliveryChannels with a CLI
- Use GetComplianceDetailsByConfigRule with a CLI
- Use GetComplianceDetailsByResource with a CLI
- Use GetComplianceSummaryByConfigRule with a CLI
- Use GetComplianceSummaryByResourceType with a CLI
- Use PutConfigRule with an AWS SDK or CLI
- Use PutDeliveryChannel with a CLI

Use `DeleteConfigRule` with an AWS SDK or CLI

The following code examples show how to use `DeleteConfigRule`.

CLI

AWS CLI

To delete an AWS Config rule

The following command deletes an AWS Config rule named `MyConfigRule`:

```
aws configservice delete-config-rule --config-rule-name MyConfigRule
```

- For API details, see DeleteConfigRule in *AWS CLI Command Reference*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class ConfigWrapper:
    """
    Encapsulates AWS Config functions.
    """

    def __init__(self, config_client):
        """
        :param config_client: A Boto3 AWS Config client.
        """
        self.config_client = config_client

    def delete_config_rule(self, rule_name):
        """
        Delete the specified rule.

        :param rule_name: The name of the rule to delete.
        """
        try:
            self.config_client.delete_config_rule(ConfigRuleName=rule_name)
            logger.info("Deleted rule %s.", rule_name)
        except ClientError:
            logger.exception("Couldn't delete rule %s.", rule_name)
            raise
```

- For API details, see DeleteConfigRule in *AWS SDK for Python (Boto3) API Reference*.

SAP ABAP

SDK for SAP ABAP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
lo_cfs->deleteconfigrule( iv_rule_name ).
MESSAGE 'Deleted AWS Config rule.' TYPE 'I'.
```

- For API details, see DeleteConfigRule in *AWS SDK for SAP ABAP API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeComplianceByConfigRule` with a CLI

The following code examples show how to use `DescribeComplianceByConfigRule`.

CLI

AWS CLI

To get compliance information for your AWS Config rules

The following command returns compliance information for each AWS Config rule that is violated by one or more AWS resources:

```
aws configservice describe-compliance-by-config-rule --compliance-
types NON_COMPLIANT
```

In the output, the value for each `CappedCount` attribute indicates how many resources do not comply with the related rule. For example, the following output indicates that 3 resources do not comply with the rule named `InstanceTypesAreT2micro`.

Output:

```
{
    "ComplianceByConfigRules": [
        {
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 3,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            },
            "ConfigRuleName": "InstanceTypesAreT2micro"
        },
        {
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 10,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            },
            "ConfigRuleName": "RequiredTagsForVolumes"
        }
    ]
}
```

- For API details, see DescribeComplianceByConfigRule in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves compliances details for the rule ebs-optimized-instance, for which there is no current evaluation results for the rule, hence it returns INSUFFICIENT_DATA

```
(Get-CFGComplianceByConfigRule -ConfigRuleName ebs-optimized-instance).Compliance
```

Output:

```
ComplianceContributorCount ComplianceType
```

```
-------------------------- --------------
                           INSUFFICIENT_DATA
```

Example 2: This example returns the number of non-compliant resources for the rule ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK.

```
(Get-CFGComplianceByConfigRule -ConfigRuleName
 ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK -ComplianceType
 NON_COMPLIANT).Compliance.ComplianceContributorCount
```

Output:

```
CapExceeded CappedCount
----------- -----------
False       2
```

- For API details, see DescribeComplianceByConfigRule in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves compliances details for the rule ebs-optimized-instance, for which there is no current evaluation results for the rule, hence it returns INSUFFICIENT_DATA

```
(Get-CFGComplianceByConfigRule -ConfigRuleName ebs-optimized-instance).Compliance
```

Output:

```
ComplianceContributorCount ComplianceType
-------------------------- --------------
                           INSUFFICIENT_DATA
```

Example 2: This example returns the number of non-compliant resources for the rule ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK.

```
(Get-CFGComplianceByConfigRule -ConfigRuleName
 ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK -ComplianceType
 NON_COMPLIANT).Compliance.ComplianceContributorCount
```

Output:

```
CapExceeded CappedCount
----------- -----------
False       2
```

- For API details, see DescribeComplianceByConfigRule in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeComplianceByResource` with a CLI

The following code examples show how to use `DescribeComplianceByResource`.

CLI

AWS CLI

To get compliance information for your AWS resources

The following command returns compliance information for each EC2 instance that is recorded by AWS Config and that violates one or more rules:

```
aws configservice describe-compliance-by-resource --resource-
type AWS::EC2::Instance --compliance-types NON_COMPLIANT
```

In the output, the value for each `CappedCount` attribute indicates how many rules the resource violates. For example, the following output indicates that instance `i-1a2b3c4d` violates 2 rules.

Output:

```
{
    "ComplianceByResources": [
        {
            "ResourceType": "AWS::EC2::Instance",
            "ResourceId": "i-1a2b3c4d",
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 2,
```

```
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            }
        },
        {
            "ResourceType": "AWS::EC2::Instance",
            "ResourceId": "i-2a2b3c4d ",
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 3,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            }
        }
    ]
}
```

- For API details, see DescribeComplianceByResource in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example checks the `AWS::SSM::ManagedInstanceInventory` resource type for 'COMPLIANT' compliance type.

```
Get-CFGComplianceByResource -ComplianceType COMPLIANT -ResourceType
 AWS::SSM::ManagedInstanceInventory
```

Output:

```
Compliance                            ResourceId          ResourceType
----------                            ----------          ------------
Amazon.ConfigService.Model.Compliance i-0123bcf4b567890e3
 AWS::SSM::ManagedInstanceInventory
Amazon.ConfigService.Model.Compliance i-0a1234f6f5d6b78f7
 AWS::SSM::ManagedInstanceInventory
```

- For API details, see DescribeComplianceByResource in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example checks the `AWS::SSM::ManagedInstanceInventory` resource type for 'COMPLIANT' compliance type.

```
Get-CFGComplianceByResource -ComplianceType COMPLIANT -ResourceType
 AWS::SSM::ManagedInstanceInventory
```

Output:

```
Compliance                            ResourceId          ResourceType
----------                            ----------          ------------
Amazon.ConfigService.Model.Compliance i-0123bcf4b567890e3
 AWS::SSM::ManagedInstanceInventory
Amazon.ConfigService.Model.Compliance i-0a1234f6f5d6b78f7
 AWS::SSM::ManagedInstanceInventory
```

- For API details, see DescribeComplianceByResource in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeConfigRuleEvaluationStatus` with a CLI

The following code examples show how to use `DescribeConfigRuleEvaluationStatus`.

CLI

AWS CLI

To get status information for an AWS Config rule

The following command returns the status information for an AWS Config rule named `MyConfigRule`:

```
aws configservice describe-config-rule-evaluation-status --config-rule-
names MyConfigRule
```

Output:

```
{
    "ConfigRulesEvaluationStatus": [
        {
            "ConfigRuleArn": "arn:aws:config:us-east-1:123456789012:config-rule/
config-rule-abcdef",
            "FirstActivatedTime": 1450311703.844,
            "ConfigRuleId": "config-rule-abcdef",
            "LastSuccessfulInvocationTime": 1450314643.156,
            "ConfigRuleName": "MyConfigRule"
        }
    ]
}
```

- For API details, see DescribeConfigRuleEvaluationStatus in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This sample returns the status information for the given config rules.

```
Get-CFGConfigRuleEvaluationStatus -ConfigRuleName root-account-mfa-enabled, vpc-
flow-logs-enabled
```

Output:

```
ConfigRuleArn                : arn:aws:config:eu-west-1:123456789012:config-rule/
config-rule-kvq1wk

LastSuccessfulEvaluationTime : 12/13/2019 7:12:01 AM
LastSuccessfulInvocationTime : 12/13/2019 7:12:01 AM
```

- For API details, see DescribeConfigRuleEvaluationStatus in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeConfigRules` with an AWS SDK or CLI

The following code examples show how to use `DescribeConfigRules`.

CLI

AWS CLI

To get details for an AWS Config rule

The following command returns details for an AWS Config rule named `InstanceTypesAreT2micro`:

```
aws configservice describe-config-rules --config-rule-
names InstanceTypesAreT2micro
```

Output:

```
{
    "ConfigRules": [
        {
            "ConfigRuleState": "ACTIVE",
            "Description": "Evaluates whether EC2 instances are the t2.micro
 type.",
            "ConfigRuleName": "InstanceTypesAreT2micro",
            "ConfigRuleArn": "arn:aws:config:us-east-1:123456789012:config-rule/
config-rule-abcdef",
            "Source": {
                "Owner": "CUSTOM_LAMBDA",
```

```
                "SourceIdentifier": "arn:aws:lambda:us-
east-1:123456789012:function:InstanceTypeCheck",
                "SourceDetails": [
                    {
                        "EventSource": "aws.config",
                        "MessageType": "ConfigurationItemChangeNotification"
                    }
                ]
            },
            "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}",
            "Scope": {
                "ComplianceResourceTypes": [
                    "AWS::EC2::Instance"
                ]
            },
            "ConfigRuleId": "config-rule-abcdef"
        }
    ]
}
```

- For API details, see DescribeConfigRules in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This sample lists config rules for the account, with selected properties.

```
Get-CFGConfigRule | Select-Object ConfigRuleName, ConfigRuleId, ConfigRuleArn,
 ConfigRuleState
```

Output:

```
ConfigRuleName                                     ConfigRuleId
 ConfigRuleArn
 ConfigRuleState
--------------                                     ------------
 -------------
 ---------------
ALB_REDIRECTION_CHECK                              config-rule-12iyn3

Use `DescribeConfigurationRecorderStatus` with a CLI

The following code examples show how to use `DescribeConfigurationRecorderStatus`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Getting started with Config

CLI

AWS CLI

To get status information for the configuration recorder

The following command returns the status of the default configuration recorder:

```
aws configservice describe-configuration-recorder-status
```

Output:

```
{
    "ConfigurationRecordersStatus": [
        {
            "name": "default",
            "lastStatus": "SUCCESS",
            "recording": true,
            "lastStatusChangeTime": 1452193834.344,
            "lastStartTime": 1441039997.819,
            "lastStopTime": 1441039992.835
        }
    ]
}
```

- For API details, see DescribeConfigurationRecorderStatus in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This sample returns status of the configuration recorders.

```
Get-CFGConfigurationRecorderStatus
```

Output:

```
LastErrorCode        :
LastErrorMessage     :
LastStartTime        : 10/11/2019 10:13:51 AM
```

```
LastStatus           : Success
LastStatusChangeTime : 12/31/2019 6:14:12 AM
LastStopTime         : 10/11/2019 10:13:46 AM
Name                 : default
Recording            : True
```

- For API details, see DescribeConfigurationRecorderStatus in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This sample returns status of the configuration recorders.

```
Get-CFGConfigurationRecorderStatus
```

Output:

```
LastErrorCode        :
LastErrorMessage     :
LastStartTime        : 10/11/2019 10:13:51 AM
LastStatus           : Success
LastStatusChangeTime : 12/31/2019 6:14:12 AM
LastStopTime         : 10/11/2019 10:13:46 AM
Name                 : default
Recording            : True
```

- For API details, see DescribeConfigurationRecorderStatus in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeConfigurationRecorders` with a CLI

The following code examples show how to use `DescribeConfigurationRecorders`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Getting started with Config

CLI

AWS CLI

To get details about the configuration recorder

The following command returns details about the default configuration recorder:

```
aws configservice describe-configuration-recorders
```

Output:

```
{
    "ConfigurationRecorders": [
        {
            "recordingGroup": {
                "allSupported": true,
                "resourceTypes": [],
                "includeGlobalResourceTypes": true
            },
            "roleARN": "arn:aws:iam::123456789012:role/config-ConfigRole-
A1B2C3D4E5F6",
            "name": "default"
        }
    ]
}
```

- For API details, see DescribeConfigurationRecorders in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the details of configuration recorders.

```
Get-CFGConfigurationRecorder | Format-List
```

Output:

```
Name           : default
RecordingGroup : Amazon.ConfigService.Model.RecordingGroup
```

```
RoleARN        : arn:aws:iam::123456789012:role/aws-service-role/
config.amazonaws.com/AWSServiceRoleForConfig
```

- For API details, see DescribeConfigurationRecorders in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns the details of configuration recorders.

```
Get-CFGConfigurationRecorder | Format-List
```

Output:

```
Name           : default
RecordingGroup : Amazon.ConfigService.Model.RecordingGroup
RoleARN        : arn:aws:iam::123456789012:role/aws-service-role/
config.amazonaws.com/AWSServiceRoleForConfig
```

- For API details, see DescribeConfigurationRecorders in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeDeliveryChannels` with a CLI

The following code examples show how to use `DescribeDeliveryChannels`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Getting started with Config

CLI

AWS CLI

To get details about the delivery channel

The following command returns details about the delivery channel:

```
aws configservice describe-delivery-channels
```

Output:

```
{
    "DeliveryChannels": [
        {
            "snsTopicARN": "arn:aws:sns:us-east-1:123456789012:config-topic",
            "name": "default",
            "s3BucketName": "config-bucket-123456789012"
        }
    ]
}
```

- For API details, see DescribeDeliveryChannels in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves the delivery channel for the region and displays details.

```
Get-CFGDeliveryChannel -Region eu-west-1 | Select-Object Name, S3BucketName,
 S3KeyPrefix,
 @{N="DeliveryFrequency";E={$_.ConfigSnapshotDeliveryProperties.DeliveryFrequency}}
```

Output:

```
Name    S3BucketName               S3KeyPrefix DeliveryFrequency
----    ------------               ----------- -----------------
default config-bucket-NA my          TwentyFour_Hours
```

- For API details, see DescribeDeliveryChannels in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves the delivery channel for the region and displays details.

```
Get-CFGDeliveryChannel -Region eu-west-1 | Select-Object Name, S3BucketName,
 S3KeyPrefix,
 @{N="DeliveryFrequency";E={$_.ConfigSnapshotDeliveryProperties.DeliveryFrequency}}
```

Output:

```
Name    S3BucketName               S3KeyPrefix DeliveryFrequency
----    ------------               ----------- -----------------
default config-bucket-NA my          TwentyFour_Hours
```

- For API details, see DescribeDeliveryChannels in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetComplianceDetailsByConfigRule` with a CLI

The following code examples show how to use `GetComplianceDetailsByConfigRule`.

CLI

AWS CLI

To get the evaluation results for an AWS Config rule

The following command returns the evaluation results for all of the resources that don't comply with an AWS Config rule named `InstanceTypesAreT2micro`:

```
aws configservice get-compliance-details-by-config-rule --config-rule-
name InstanceTypesAreT2micro --compliance-types NON_COMPLIANT
```

Output:

```
{
```

```
    "EvaluationResults": [
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314645.261,
            "ConfigRuleInvokedTime": 1450314642.948,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-2a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314645.18,
            "ConfigRuleInvokedTime": 1450314642.902,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-3a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314643.346,
            "ConfigRuleInvokedTime": 1450314643.124,
            "ComplianceType": "NON_COMPLIANT"
        }
    ]
}
```

- For API details, see GetComplianceDetailsByConfigRule in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example obtains the evaluation results for the rule access-keys-rotated and returns the output grouped by compliance-type

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-keys-rotated | Group-
Object ComplianceType
```

Output:

```
Count Name                      Group
----- ----                      -----
    2 COMPLIANT                 {Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationResult}
    5 NON_COMPLIANT             {Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationRes...
```

Example 2: This example queries compliance details for the rule access-keys-rotated for COMPLIANT resources.

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-
keys-rotated -ComplianceType COMPLIANT | ForEach-Object
 {$_.EvaluationResultIdentifier.EvaluationResultQualifier}
```

Output:

```
ConfigRuleName      ResourceId            ResourceType
--------------      ----------            ------------
access-keys-rotated BCAB1CDJ2LITAPVEW3JAH AWS::IAM::User
access-keys-rotated BCAB1CDJ2LITL3EHREM4Q AWS::IAM::User
```

- For API details, see GetComplianceDetailsByConfigRule in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example obtains the evaluation results for the rule access-keys-rotated and returns the output grouped by compliance-type

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-keys-rotated | Group-
Object ComplianceType
```

Output:

```
Count Name                      Group
----- ----                      -----
    2 COMPLIANT                 {Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationResult}
    5 NON_COMPLIANT             {Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationRes...
```

Example 2: This example queries compliance details for the rule access-keys-rotated for COMPLIANT resources.

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-
keys-rotated -ComplianceType COMPLIANT | ForEach-Object
 {$_.EvaluationResultIdentifier.EvaluationResultQualifier}
```

Output:

```
ConfigRuleName      ResourceId            ResourceType
--------------      ----------            ------------
access-keys-rotated BCAB1CDJ2LITAPVEW3JAH AWS::IAM::User
access-keys-rotated BCAB1CDJ2LITL3EHREM4Q AWS::IAM::User
```

- For API details, see GetComplianceDetailsByConfigRule in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetComplianceDetailsByResource` with a CLI

The following code examples show how to use `GetComplianceDetailsByResource`.

CLI

AWS CLI

To get the evaluation results for an AWS resource

The following command returns the evaluation results for each rule with which the EC2 instance `i-1a2b3c4d` does not comply:

```
aws configservice get-compliance-details-by-resource --resource-
type AWS::EC2::Instance --resource-id i-1a2b3c4d --compliance-types NON_COMPLIANT
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314643.288,
            "ConfigRuleInvokedTime": 1450314643.034,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "RequiredTagForEC2Instances"
                }
            },
            "ResultRecordedTime": 1450314645.261,
            "ConfigRuleInvokedTime": 1450314642.948,
            "ComplianceType": "NON_COMPLIANT"
        }
    ]
```

```
}
```

- For API details, see GetComplianceDetailsByResource in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example evaulation results for the given resource.

```
Get-CFGComplianceDetailsByResource -ResourceId ABCD5STJ4EFGHIVEW6JAH -
ResourceType 'AWS::IAM::User'
```

Output:

```
Annotation                 :
ComplianceType             : COMPLIANT
ConfigRuleInvokedTime      : 8/25/2019 11:34:56 PM
EvaluationResultIdentifier :
 Amazon.ConfigService.Model.EvaluationResultIdentifier
ResultRecordedTime         : 8/25/2019 11:34:56 PM
ResultToken                :
```

- For API details, see GetComplianceDetailsByResource in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example evaulation results for the given resource.

```
Get-CFGComplianceDetailsByResource -ResourceId ABCD5STJ4EFGHIVEW6JAH -
ResourceType 'AWS::IAM::User'
```

Output:

```
Annotation                 :
ComplianceType             : COMPLIANT
ConfigRuleInvokedTime      : 8/25/2019 11:34:56 PM
EvaluationResultIdentifier :
 Amazon.ConfigService.Model.EvaluationResultIdentifier
```

```
ResultRecordedTime          : 8/25/2019 11:34:56 PM
ResultToken                 :
```

- For API details, see GetComplianceDetailsByResource in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetComplianceSummaryByConfigRule` with a CLI

The following code examples show how to use `GetComplianceSummaryByConfigRule`.

CLI

AWS CLI

To get the compliance summary for your AWS Config rules

The following command returns the number of rules that are compliant and the number that are noncompliant:

```
aws configservice get-compliance-summary-by-config-rule
```

In the output, the value for each `CappedCount` attribute indicates how many rules are compliant or noncompliant.

Output:

```
{
    "ComplianceSummary": {
        "NonCompliantResourceCount": {
            "CappedCount": 3,
            "CapExceeded": false
        },
        "ComplianceSummaryTimestamp": 1452204131.493,
        "CompliantResourceCount": {
            "CappedCount": 2,
            "CapExceeded": false
```

```
        }
    }
}
```

- For API details, see GetComplianceSummaryByConfigRule in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This sample returns the number of Config rules that are non-compliant.

```
Get-CFGComplianceSummaryByConfigRule -Select
 ComplianceSummary.NonCompliantResourceCount
```

Output:

```
CapExceeded CappedCount
----------- -----------
False       9
```

- For API details, see GetComplianceSummaryByConfigRule in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This sample returns the number of Config rules that are non-compliant.

```
Get-CFGComplianceSummaryByConfigRule -Select
 ComplianceSummary.NonCompliantResourceCount
```

Output:

```
CapExceeded CappedCount
----------- -----------
False       9
```

- For API details, see GetComplianceSummaryByConfigRule in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetComplianceSummaryByResourceType` with a CLI

The following code examples show how to use `GetComplianceSummaryByResourceType`.

CLI

AWS CLI

To get the compliance summary for all resource types

The following command returns the number of AWS resources that are noncompliant and the number that are compliant:

```
aws configservice get-compliance-summary-by-resource-type
```

In the output, the value for each `CappedCount` attribute indicates how many resources are compliant or noncompliant.

Output:

```
{
    "ComplianceSummariesByResourceType": [
        {
            "ComplianceSummary": {
                "NonCompliantResourceCount": {
                    "CappedCount": 16,
                    "CapExceeded": false
                },
                "ComplianceSummaryTimestamp": 1453237464.543,
                "CompliantResourceCount": {
                    "CappedCount": 10,
                    "CapExceeded": false
                }
            }
        }
    ]
}
```

To get the compliance summary for a specific resource type

The following command returns the number of EC2 instances that are noncompliant and the number that are compliant:

```
aws configservice get-compliance-summary-by-resource-type --resource-
types AWS::EC2::Instance
```

In the output, the value for each `CappedCount` attribute indicates how many resources are compliant or noncompliant.

Output:

```
{
    "ComplianceSummariesByResourceType": [
        {
            "ResourceType": "AWS::EC2::Instance",
            "ComplianceSummary": {
                "NonCompliantResourceCount": {
                    "CappedCount": 3,
                    "CapExceeded": false
                },
                "ComplianceSummaryTimestamp": 1452204923.518,
                "CompliantResourceCount": {
                    "CappedCount": 7,
                    "CapExceeded": false
                }
            }
        }
    ]
}
```

- For API details, see GetComplianceSummaryByResourceType in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This sample returns the number of resources that are compliant or noncompliant and converts the output to json.

```
Get-CFGComplianceSummaryByResourceType -Select
 ComplianceSummariesByResourceType.ComplianceSummary | ConvertTo-Json
{
  "ComplianceSummaryTimestamp": "2019-12-14T06:14:49.778Z",
  "CompliantResourceCount": {
    "CapExceeded": false,
    "CappedCount": 2
  },
  "NonCompliantResourceCount": {
    "CapExceeded": true,
    "CappedCount": 100
  }
}
```

- For API details, see GetComplianceSummaryByResourceType in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This sample returns the number of resources that are compliant or noncompliant and converts the output to json.

```
Get-CFGComplianceSummaryByResourceType -Select
 ComplianceSummariesByResourceType.ComplianceSummary | ConvertTo-Json
{
  "ComplianceSummaryTimestamp": "2019-12-14T06:14:49.778Z",
  "CompliantResourceCount": {
    "CapExceeded": false,
    "CappedCount": 2
  },
  "NonCompliantResourceCount": {
    "CapExceeded": true,
    "CappedCount": 100
  }
}
```

- For API details, see GetComplianceSummaryByResourceType in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use PutConfigRule with an AWS SDK or CLI

The following code examples show how to use PutConfigRule.

CLI

AWS CLI

To add an AWS managed Config rule

The following command provides JSON code to add an AWS managed Config rule:

```
aws configservice put-config-rule --config-rule file://
RequiredTagsForEC2Instances.json
```

RequiredTagsForEC2Instances.json is a JSON file that contains the rule configuration:

```
{
  "ConfigRuleName": "RequiredTagsForEC2Instances",
  "Description": "Checks whether the CostCenter and Owner tags are applied to EC2
 instances.",
  "Scope": {
    "ComplianceResourceTypes": [
      "AWS::EC2::Instance"
    ]
  },
  "Source": {
    "Owner": "AWS",
    "SourceIdentifier": "REQUIRED_TAGS"
  },
  "InputParameters": "{\"tag1Key\":\"CostCenter\",\"tag2Key\":\"Owner\"}"
}
```

For the ComplianceResourceTypes attribute, this JSON code limits the scope to resources of the AWS::EC2::Instance type, so AWS Config will evaluate only EC2 instances against the rule. Because the rule is a managed rule, the Owner attribute is set to AWS, and the SourceIdentifier attribute is set to the rule identifier, REQUIRED_TAGS. For the InputParameters attribute, the tag keys that the rule requires, CostCenter and Owner, are specified.

If the command succeeds, AWS Config returns no output. To verify the rule configuration, run the describe-config-rules command, and specify the rule name.

To add a customer managed Config rule

The following command provides JSON code to add a customer managed Config rule:

```
aws configservice put-config-rule --config-rule file://
InstanceTypesAreT2micro.json
```

`InstanceTypesAreT2micro.json` is a JSON file that contains the rule configuration:

```
{
  "ConfigRuleName": "InstanceTypesAreT2micro",
  "Description": "Evaluates whether EC2 instances are the t2.micro type.",
  "Scope": {
    "ComplianceResourceTypes": [
      "AWS::EC2::Instance"
    ]
  },
  "Source": {
    "Owner": "CUSTOM_LAMBDA",
    "SourceIdentifier": "arn:aws:lambda:us-
east-1:123456789012:function:InstanceTypeCheck",
    "SourceDetails": [
      {
        "EventSource": "aws.config",
        "MessageType": "ConfigurationItemChangeNotification"
      }
    ]
  },
  "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}"
}
```

For the `ComplianceResourceTypes` attribute, this JSON code limits the scope to resources of the `AWS::EC2::Instance` type, so AWS Config will evaluate only EC2 instances against the rule. Because this rule is a customer managed rule, the `Owner` attribute is set to `CUSTOM_LAMBDA`, and the `SourceIdentifier` attribute is set to the ARN of the AWS Lambda function. The `SourceDetails` object is required. The parameters that are specified for the `InputParameters` attribute are passed to the AWS Lambda function when AWS Config invokes it to evaluate resources against the rule.

If the command succeeds, AWS Config returns no output. To verify the rule configuration, run the describe-config-rules command, and specify the rule name.

- For API details, see PutConfigRule in *AWS CLI Command Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutDeliveryChannel` with a CLI

The following code examples show how to use `PutDeliveryChannel`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Getting started with Config

CLI

AWS CLI

To create a delivery channel

The following command provides the settings for the delivery channel as JSON code:

```
aws configservice put-delivery-channel --delivery-channel file://
deliveryChannel.json
```

The `deliveryChannel.json` file specifies the delivery channel attributes:

```
{
    "name": "default",
    "s3BucketName": "config-bucket-123456789012",
    "snsTopicARN": "arn:aws:sns:us-east-1:123456789012:config-topic",
    "configSnapshotDeliveryProperties": {
        "deliveryFrequency": "Twelve_Hours"
```

```
    }
}
```

This example sets the following attributes:

`name` - The name of the delivery channel. By default, AWS Config assigns the name `default` to a new delivery channel.You cannot update the delivery channel name with the `put-delivery-channel` command. For the steps to change the name, see Renaming the Delivery Channel.`s3BucketName` - The name of the Amazon S3 bucket to which AWS Config delivers configuration snapshots and configuration history files.If you specify a bucket that belongs to another AWS account, that bucket must have policies that grant access permissions to AWS Config. For more information, see Permissions for the Amazon S3 Bucket.

`snsTopicARN` - The Amazon Resource Name (ARN) of the Amazon SNS topic to which AWS Config sends notifications about configuration changes.If you choose a topic from another account, the topic must have policies that grant access permissions to AWS Config. For more information, see Permissions for the Amazon SNS Topic.

`configSnapshotDeliveryProperties` - Contains the `deliveryFrequency` attribute, which sets how often AWS Config delivers configuration snapshots and how often it invokes evaluations for periodic Config rules.

If the command succeeds, AWS Config returns no output. To verify the settings of your delivery channel, run the describe-delivery-channels command.

- For API details, see PutDeliveryChannel in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example changes the deliveryFrequency property of an existing delivery channel.

```
Write-CFGDeliveryChannel -ConfigSnapshotDeliveryProperties_DeliveryFrequency
 TwentyFour_Hours -DeliveryChannelName default -DeliveryChannel_S3BucketName
 amzn-s3-demo-bucket -DeliveryChannel_S3KeyPrefix my
```

- For API details, see PutDeliveryChannel in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example changes the deliveryFrequency property of an existing delivery channel.

```
Write-CFGDeliveryChannel -ConfigSnapshotDeliveryProperties_DeliveryFrequency
 TwentyFour_Hours -DeliveryChannelName default -DeliveryChannel_S3BucketName
 amzn-s3-demo-bucket -DeliveryChannel_S3KeyPrefix my
```

- For API details, see PutDeliveryChannel in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using AWS Config with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Scenarios for AWS Config using AWS SDKs

The following code examples show you how to implement common scenarios in AWS Config with AWS SDKs. These scenarios show you how to accomplish specific tasks by calling multiple functions within AWS Config or combined with other AWS services. Each scenario includes a link to the complete source code, where you can find instructions on how to set up and run the code.

Scenarios target an intermediate level of experience to help you understand service actions in context.

Examples

- Getting started with Config

Getting started with Config

The following code example shows how to:

- Create an Amazon S3 bucket
- Create an Amazon SNS topic
- Create an IAM role for Config
- Set up the Config configuration recorder
- Set up the Config delivery channel

- Start the configuration recorder
- Verify the Config setup

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

Document History

The following table describes the important changes to the documentation for AWS Config. For notification about updates to this documentation, you can subscribe to an RSS feed.

- **API version**: 2014-11-12
- **Latest documentation update**: May 26, 2026

Change	Description	Date
New resource types for AWS Config	With this release, you can use AWS Config to record configuration changes to new Amazon Bedrock and Amazon SageMaker AI Config resource types. For more information, see Supported resource types.	June 4, 2026
Updated service-linked recorder entries for AWS Security Hub	Updated the supported services table for service-linked configuration recorders. Added a Recorder name column. Updated the securityhub.amazonaws.com entry and added two new service-linked recorder entries (AWSConfigurationRecorderForSecurityHubAssets and AWSConfigurationRecorderForSecurityHubAssetsGlobal) with the securityhubv2.amazonaws.com service principal.	June 2, 2026
Clarify Advanced Query searchable fields support	Updated Advanced Query documentation to include	May 26, 2026

	more information about searchable fields and how that impacts retrieval in Advanced Query.	
New resource types for AWS Config	With this release, you can use AWS Config to record configuration changes to new Amazon CloudWatch Application Signals, Amazon ARC Zonal Shift, AWS B2B Data Interchange, AWS Cost Explorer, AWS Clean Rooms, AWS CodeArtifact, Amazon Connect, Amazon EKS, Amazon GameLift, AWS Glue, Amazon CloudWatch Internet Monitor, AWS IoT, AWS IoT Wireless, Amazon Kinesis, AWS Private CA Connector for SCEP, Amazon Q Business, Amazon QuickSight, Amazon Route 53, AWS Systems Manager, and AWS Transfer Family Config resource types. For more information, see Supported resource types.	May 8, 2026

AWS Config updates NZISM conformance packs	With this release, AWS Config supports the following conformance packs: • NZISM (v3.9) Control mapping to AWS Managed Config Rules Extension • NZISM (v3.9) Control mapping to AWS Managed Config Rules Foundation • NZISM (v3.9) Control mapping to AWS Managed Config Rules NZ Transition	May 7, 2026
Security IAM updates	The `AWSConfigServiceRolePolicy` and `AWS_ConfigRole` policies now grant additional permissions for bedrock, bedrock-agentcore, cloudtrail, cloudwatch, connect, dynamodb, elasticloadbalancing, lambda, license-manager, redshift, s3, s3express, and sagemaker services. For more information, see AWS managed policies for AWS Config.	May 5, 2026

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • bedrockagentcore-gateway-authorizer-enabled • bedrockagentcore-runtime-private-network-required • bedrock-agentcore-memory-encryption-enabled • sagemaker-featuregroup-online-store-encryption • sagemaker-model-multicontainer-private-registry	April 27, 2026
AWS Config deprecates managed rule	With this release, AWS Config is marking the managed rule ecs-task-definition-memory-hard-limit as deprecated.	April 3, 2026
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • ec2-vpn-connection-ike-version-check • eks-nodegroup-supported-version-check • kendra-index-tagged • sagemaker-featuregroup-encryption-at-rest • sagemaker-model-private-registry-required	April 2, 2026

AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • AI/ML Security & Governance Supporting Infrastructure Best Practices • Amazon Bedrock Security and Governance Best Practices • Amazon SageMaker AI Security and Governance Best Practices • Self-Hosted AI/ML Security & Governance Best Practices	March 20, 2026
Security IAM updates	The `AWSConfigServiceRolePolicy` and `AWS_ConfigRole` policies now grant additional permissions for auditmanager, bcm-dashboards, bedrock, bedrock-agentcore, chime, dms, emr-containers, gameliftstreams, globalaccelerator, glue, lambda, medialive, mediapackagev2, outposts, qbusiness, redshift, rtbfabric, s3express, s3vectors, sagemaker, servicecatalog, ssm-contacts, ssm-guiconnect, sso, textract, transfer, and wisdom services. For more information, see AWS managed policies for AWS Config.	March 10, 2026

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • acm-certificate-transparent-logging-enabled • amplify-app-build-spec-configured • amplify-app-platform-check • amplify-branch-auto-build-enabled • amplify-branch-build-spec-configured • amplify-branch-framework-configured • amplify-branch-pull-request-preview-enabled • apigateway-domain-name-tls-check • apigatewayv2-integration-private-https-enabled • appintegrations-application-approved-origins-check • appintegrations-application-tagged • appmesh-mesh-ip-pref-check • appmesh-virtual-gateway-listeners-health-check-enabled • appmesh-virtual-node-listeners-health-check-enabled	March 4, 2026

Security IAM updates	The `AWSConfigServiceRolePolicy` and `AWS_ConfigRole` policies now grant additional permissions: application-autoscaling:DescribeScheduledActions, appsync:GetApiAssociation, cloudformation:DescribeStacks, cloudformation:GetStackPolicy, cloudformation:GetTemplate, cloudfront:GetKeyGroup, cloudfront:GetMonitoringSubscription, cloudfront:ListKeyGroups, connect:ListEvaluationFormVersions, cur:DescribeReportDefinitions, cur:ListTagsForResource, and permissions for datazone, docdb-elastic, ec2, fis, frauddetector, guardduty, iotfleetwise, iotsitewise, iotwireless, kendra, logs, mediaconnect, medialive, networkmanager, notifications, refactor-spaces, resource-explorer-2, route53resolver, securityhub, sms-voice, and workspaces-web services. For more information, see AWS managed policies for AWS Config.	February 17, 2026

Security IAM updates	The `AWSConfigServiceRolePolicy` and `AWS_ConfigRole` policies have been updated with comprehensive permissions for AWS resource configuration recording across over 100 AWS services. For more information, see AWS managed policies for AWS Config.	January 27, 2026
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • cloudformation-stack-service-role-check • cloudfront-distribution-key-group-enabled • ecs-capacity-provider-termination-check • ecs-task-definition-linux-user-non-root • ecs-task-definition-windows-user-non-admin	January 9, 2026
AWS Config supports new permissions required for S3 Tables	With this release, AWS Config added new required permissions to record S3 Tables resource types. For more information, see Supported resource types.	January 9, 2026

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • aurora-global-database-encryption-at-rest • cloudformation-termination-protection-check • cognito-userpool-cust-auth-threat-full-check • cognito-user-pool-deletion-protection-enabled • cognito-user-pool-mfa-enabled • ebs-snapshot-block-public-access • ecs-task-definition-efs-encryption-enabled • ses-sending-tls-required	December 8, 2025

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • aurora-global-database-encryption-at-rest • cloudformation-termination-protection-check • cognito-userpool-cust-auth-threat-full-check • cognito-user-pool-deletion-protection-enabled • cognito-user-pool-mfa-enabled • ebs-snapshot-block-public-access • ecs-task-definition-efs-encryption-enabled • ses-sending-tls-required	December 8, 2025
???	The example Cross-Account S3 Bucket Policy no longer includes the `config.amazonaws.com` Service Principal. For more information, see required-permissions-cross-account.	December 3, 2025

Security IAM updates	The `AWSConfigServiceRolePolicy` and `AWS_ConfigRole` policies now grants additional permissions for Amazon Lightsail and Amazon Simple Storage Service (Amazon S3). For more information, see AWS managed policies for AWS Config.	November 20, 2025
Security IAM update	AWS Config has updated the managed policy `AWSConfigServiceRolePolicy` with enhanced documentation of comprehensive permissions for AWS resource configuration recording across over 100 AWS services. For information, see AWS Config updates to AWS managed policies.	November 11, 2025
Security IAM update	AWS Config has updated the managed policy `AWS_ConfigRole` with comprehensive permissions for AWS resource configuration recording across multiple services. For more information, see AWS managed policies for AWS Config.	November 10, 2025

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • amplify-app-no-environment-variables • amplify-branch-description • api-gwv2-stage-default-route-detailed-metrics-enabled • apigateway-stage-description • apigatewayv2-stage-description • appconfig-deployment-strategy-tagged • aps-rule-groups-namespace-tagged • auditmanager-assessment-tagged • batch-managed-spot-compute-environment-max-bid • cognito-identity-pool-unauthenticated-logins • customerprofiles-domain-tagged • devicefarm-project-tagged • devicefarm-test-grid-project-tagged • ec2-network-insights-analysis-tagged • eks-fargate-profile-tagged	October 27, 2025

AWS Config supports new resource types	With this release, you can use AWS Config to record configuration changes to new Amazon API Gateway, AWS CloudTrail, and AWS Config resource types. For more information, see Supported resource types.	October 10, 2025
AWS Config supports new conformance pack	With this release, AWS Config supports the following conformance pack: Cyber Resilience Best Practices for Amazon S3, Amazon EBS, and Amazon DynamoDB	October 3, 2025

Security IAM updates	The `AWSConfigServiceRolePolicy` and `AWS_ConfigRole` policies now grants additional permissions for AWS Amplify, AWS AppSync, Amazon Bedrock, AWS CloudTrail, CloudFormation, AWS CodeArtifact, AWS CodePipeline, Connect Customer, AWS Deadline Cloud, Amazon EC2, AWS Entity Resolution, AWS IoT SiteWise, Amazon IVS, AWS Lambda, Amazon EventBridge, Amazon Quick, Amazon Redshift, Amazon Redshift Serverless, AWS Identity and Access Management Roles Anywhere, Amazon SageMaker, AWS Secrets Manager, Amazon Security Lake, AWS Service Catalog, AWS Shield, Amazon EC2 Systems Manager, and AWS WAFV2. For more information, see AWS managed policies for AWS Config.	October 1, 2025

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • cognito-user-pool-password-policy-check • dms-replication-instance-multi-az-enabled • ec2-launch-templates-ebs-volume-encrypted • rds-mysql-cluster-copy-tags-to-snapshot-check • rds-pgsql-cluster-copy-tags-to-snapshot-check	October 1, 2025
AWS Config supports new resource types in the Asia Pacific (Taipei) Region region	With this release, AWS Config now supports the following AWS WAFV2 resource types in the Asia Pacific (Taipei) Region region: • AWS::WAFv2::IPSet • AWS::WAFv2::ManagedRuleSet • AWS::WAFv2::RegexPatternSet • AWS::WAFv2::RuleGroup • AWS::WAFv2::WebACL For more information, see Resource Coverage by Region Availability.	September 23, 2025

AWS Config updates conformance packs	With this release, AWS Config has updated the following conformance packs: • Operational Best Practices for ACSC Essential 8 • Operational Best Practices for ACSC ISM - Part 2	September 9, 2025
AWS Config supports new resource types	With this release, you can use AWS Config to record configuration changes to new AWS CodeArtifact, AWS Config, AWS Glue, AWS Network Manager, and AWS Identity and Access Management resource types. For more information, see Supported resource types.	September 3, 2025
AWS Config supports new resource types	With this release, you can use AWS Config to record configuration changes to new AWS Backup, Amazon OpenSearch Service, Amazon EC2, Amazon Managed Streaming for Apache Kafka, Amazon Redshift, Route 53 Profiles, AWS Systems Manager Incident Manager, AWS Transfer Family, and Amazon CloudFront resource types. For more information, see Supported resource types.	August 15, 2025

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • cloudfront-origin-lambda-url-oac-enabled • sqs-queue-policy-full-access-check • sqs-queue-dlq-check	August 14, 2025

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • alb-tagged • api-gw-rest-api-tagged • api-gw-stage-tagged • appsync-graphql-api-xray-enabled • cloudwatch-metric-stream-tagged • codebuild-report-group-tagged • datasync-location-object-storage-using-https • ec2-vpn-connection-tagged • ecs-capacity-provider-tagged • efs-file-system-tagged • eks-addon-tagged • elb-internal-scheme-check • elb-tagged • glb-tagged • iot-job-template-tagged • iotdevicedefender-custom-metric-tagged • kms-key-tagged • msk-cluster-tagged • nlb-tagged • rds-event-subscription-tagged • rds-option-group-tagged	August 13, 2025

Security IAM updates	The `AWS_ConfigRole` policy now grants additional permissions for AWS ARC - Zonal Shift, Amazon Bedrock, AWS CloudTrail, AWS CodeArtifact, AWS Deadline Cloud, AWS Database Migration Service, AWS Glue, AWS Identity and Access Management, Amazon Managed Streaming for Apache Kafka, AWS Lake Formation, Amazon CloudWatch Logs, AWS Elemental MediaLive, AWS Elemental MediaPackage, Amazon Relational Database Service, Amazon Simple Storage Service, AWS Secrets Manager, Amazon Security Lake, AWS Service Catalog, Amazon Simple Email Service, and AWS X-Ray. For more information, see AWS managed policies for AWS Config.	July 28, 2025

Security IAM updates	The `AWSConfigServiceRolePolicy` policy now grants additional permissions for AWS ARC - Zonal Shift, Amazon Bedrock, AWS CloudTrail, AWS CodeArtifact, AWS Deadline Cloud, AWS Database Migration Service, AWS Glue, AWS Identity and Access Management, Amazon Managed Streaming for Apache Kafka, AWS Lake Formation, Amazon CloudWatch Logs, AWS Elemental MediaLive, AWS Elemental MediaPackage, Amazon Relational Database Service, Amazon Simple Storage Service, AWS Secrets Manager, Amazon Security Lake, AWS Service Catalog, Amazon Simple Email Service, AWS X-Ray, and Amazon API Gateway. For more information, see AWS managed policies for AWS Config.	July 28, 2025

AWS Config supports new resource types	With this release, you can use AWS Config to record configuration changes to new AWS Backup, AWS Billing and Cost Management, CloudFormation, Amazon CloudFront, AWS Entity Resolution, AWS IoT, AWS Private Certificate Authority, Amazon Relational Database Service, and Amazon S3 resource types. For more information, see Supported resource types.	July 15, 2025
Security IAM updates	The `AWS_ConfigRole` policy and `AWSConfigServiceRolePolicy` policy now grants additional permissions for AWS Backup gateway, AWS Billing and Cost Management, Amazon Bedrock, AWS CloudFormation, Amazon CloudFront, AWS Entity Resolution, AWS IoT Core Device Advisor, AWS Lambda, AWS Network Manager, AWS Private Certificate Authority, Amazon Redshift, Amazon S3 Tables, AWS Systems Manager Quick Setup. For more information, see AWS managed policies for AWS Config.	June 18, 2025

AWS Config supports new resource types	With this release, you can use AWS Config to record configuration changes to new Amazon Bedrock resource types. For more information, see Supported resource types.	June 17, 2025

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • cloudfront-ssl-policy-check • cognito-identity-pool-unauth-access-check • ec2-enis-source-destination-check-enabled • elbv2-listener-encryption-in-transit • lambda-function-xray-enabled • msk-cluster-public-access-disabled • msk-connect-connector-logging-enabled • msk-unrestricted-access-check • aurora-mysql-cluster-audit-logging • redshift-cluster-multi-az-enabled • s3express-dir-bucket-lifecycle-rules-check • ssm-automation-logging-enabled • ssm-automation-block-public-sharing	June 13, 2025

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Bedrock. For more information, see AWS managed policies for AWS Config.	May 27, 2025
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon App Integrations, Amazon Elastic Compute Cloud (Amazon EC2), Amazon Inspector, Amazon Macie, Amazon Route 53 Profiles, Amazon OpenSearch Serverless, Amazon Simple Storage Service (Amazon S3), AWS Security Hub CSPM, and Amazon SageMaker AI resource types. For more information, see Supported Resource Types.	April 30, 2025
AWS Config updates managed rules	With this release, AWS Config supports the following managed rule: redshift-serverless-default-db-name-check	April 22, 2025
AWS Config updates managed rules	With this release, AWS Config supports the following managed rule: redshift-serverless-default-admin-check	April 17, 2025

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for AWS B2B Data Interchange, Amazon Bedrock, AWS Clean Rooms, AWS CodeConnections, AWS Direct Connect, AWS Database Migration Service (AWS DMS), Amazon CloudWatch Logs, Amazon Macie, Amazon Managed Blockchain, Amazon Q Business, Route 53 Profiles, Amazon Simple Storage Service (Amazon S3), Amazon SageMaker AI, AWS Security Hub CSPM, and AWS Systems Manager Incident Manager, AWS Systems Manager Incident Manager Contacts, and AWS Systems Manager. For more information, see AWS managed policies for AWS Config.	April 8, 2025

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • s3-bucket-tagged • ecr-repository-tagged • sagemaker-feature-group-tagged • sagemaker-domain-tagged • cognito-user-pool-tagged	April 1, 2025

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • nlb-cross-zone-load-balancing-enabled • redshift-serverless-publish-logs-to-cloudwatch • rds-instance-subnet-igw-check • ec2-spot-fleet-request-ct-encryption-at-rest • redshift-serverless-workgroup-encrypted-in-transit • redshift-serverless-workgroup-no-public-access • redshift-serverless-namespace-cmk-encryption • event-data-store-cmk-encryption-enabled • ecs-task-definition-network-mode-not-host • rds-proxy-tls-encryption • nlb-logging-enabled • redshift-audit-logging-enabled • s3-lifecycle-policy-check • sagemaker-image-tagged • redshift-cluster-parameter-group-tagged • ec2-dhcp-options-tagged • sagemaker-app-image-config-tagged	March 22, 2025

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for AWS AppConfig, AWS CloudTrail, Amazon Connect Customer, Amazon DataZone, Amazon DevOps Guru, AWS Glue, Identity Store, AWS IoT, AWS IoT FleetWise, AWS IoT Wireless, Amazon Interactive Video Service (Amazon IVS), Amazon CloudWatch Logs, Amazon CloudWatch Observability Access Manager, AWS Payment Cryptography, Amazon Relational Database Service (Amazon RDS), Amazon Rekognition, Amazon Simple Storage Service (Amazon S3), Amazon EventBridge Scheduler, AWS Systems Manager, and Amazon VPC Lattice. For more information, see AWS managed policies for AWS Config.	November 8, 2024
AWS Config updates managed rules	With this release, AWS Config supports the following managed rule: cognito-user-pool-advanced-security-enabled	November 6, 2024

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • active-mq-supported-version • rabbit-mq-supported-version • ec2-vpn-connection-logging-enabled • appsync-cache-ct-encryption-at-rest • appsync-cache-ct-encryption-in-transit • vpc-endpoint-enabled • efs-filesystem-ct-encrypted • redshift-cluster-subnet-group-multi-az • sns-topic-no-public-access • rabbit-mq-supported-version • kms-key-policy-no-public-access • rds-mysql-instance-encrypted-in-transit • rds-postgres-instance-encrypted-in-transit • rds-sql-server-logs-to-cloudwatch • ec2-launch-template-imdsv2-check	October 21, 2024

AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • Operational Best Practices for PCI DSS 4.0 (Excluding global resource types) • Operational Best Practices for PCI DSS 4.0 (Including global resource types)	September 23, 2024
Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon OpenSearch Service Severless, Amazon AppStream, AWS Backup, AWS CloudTrail, AWS Glue, EC2 Image Builder, AWS IoT, Amazon Interactive Video Service (Amazon IVS), AWS Elemental MediaConnect, AWS Elemental MediaTail or, AWS HealthOmics, and Amazon EventBridge Scheduler. For more information, see AWS managed policies for AWS Config.	September 16, 2024

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • ec2-resources-in-logically-air-gapped-vault • ebs-resources-in-logically-air-gapped-vault • aurora-resources-in-logically-air-gapped-vault • efs-resources-in-logically-air-gapped-vault • s3-resources-in-logically-air-gapped-vault • storagegateway-resources-in-logically-air-gapped-vault • virtualmachine-resources-in-logically-air-gapped-vault	September 3, 2024
AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • Operational Best Practices for FedRAMP (High Part 1) • Operational Best Practices for FedRAMP (High Part 2)	August 27, 2024

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • athena-workgroup-logging-enabled • codebuild-report-group-encrypted-at-rest • cognito-user-pool-advanced-security-enabled • datasync-task-logging-enabled • efs-automatic-backups-enabled • glue-job-logging-enabled • glue-ml-transform-encrypted-at-rest • kinesis-stream-backup-retention-check • rds-aurora-postgresql-logs-to-cloudwatch • rds-postgresql-logs-to-cloudwatch • workspaces-root-volume-encryption-enabled • workspaces-user-volume-encryption-enabled	July 22, 2024

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Elastic File System (Amazon EFS), Amazon Redshift and AWS Systems Manager for SAP. For more information, see AWS managed policies for AWS Config.	June 17, 2024
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • cloudtrail-s3-bucket-public-access-prohibited • cloudtrail-s3-bucket-access-logging	May 8, 2024
AWS Config updates managed rules	With this release, AWS Config supports the following managed rule: iam-external-access-analyzer-enabled	May 2, 2024

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • guardduty-malware-protection-enabled • guardduty-rds-protection-enabled • guardduty-s3-protection-enabled • inspector-lambda-standard-scan-enabled	April 26, 2024
AWS Config simplifies usage analysis with Amazon CloudWatch	With this release, the Amazon CloudWatch metrics for monitoring AWS Config data usage will display only billable usage. This means, non-billable usage will no longer be displayed in both the Amazon CloudWatch metrics emitted to AWS Config and the AWS Config console. This allows you to validate AWS Config setup and usage using Amazon CloudWatch metrics and correlate billable usage with associated costs. For more information, see AWS Config Usage and Success Metrics.	April 26, 2024
AWS Config updates managed rules	With this release, AWS Config supports the following managed rule: iam-server-certificate-expiration-check	April 23, 2024

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • vpc-sg-port-restriction-check • cloudtrail-all-write-s3-data-event-check • cloudtrail-all-read-s3-data-event-check	April 17, 2024
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • guardduty-eks-protection-audit-enabled • guardduty-eks-protection-runtime-enabled • guardduty-lambda-protection-enabled • inspector-ec2-scan-enabled • inspector-ecr-scan-enabled • inspector-lambda-code-scan-enabled • redshift-unrestricted-port-access	April 16, 2024
AWS Config updates managed rules	With this release, AWS Config supports the following managed rule: efs-mount-target-public-accessible	March 20, 2024

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • dms-neptune-iam-authorization-enabled • dms-mongo-db-authentication-enabled • dms-redis-tls-enabled • dax-tls-endpoint-encryption • eks-cluster-secrets-encrypted • kinesis-firehose-delivery-stream-encrypted • mq-cloudwatch-audit-log-enabled • mq-cloudwatch-audit-log-enabled • opensearch-primary-node-fault-tolerance • sagemaker-endpoint-config-prod-instance-count • service-catalog-shared-within-organization • transfer-family-server-no-ftp	February 26, 2024

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Managed Service for Prometheus, Amazon CloudWatch, Amazon Cognito, Amazon ElastiCache, Amazon FSx, AWS Glue, AWS Identity and Access Management (IAM), AWS Lambda, AWS RAM, Amazon Redshift Serverless, Amazon SageMaker AI, and Amazon Simple Notification Service (Amazon SNS). For more information, see AWS managed policies for AWS Config.	February 22, 2024
AWS Config updates managed rules	With this release, AWS Config supports the following managed rule: s3-bucket-cross-region-replication-enabled	February 12, 2024

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new AWS AppConfig, Amazon CloudWatch Evidently, AWS Identity and Access Management (IAM), Amazon MemoryDB (MemoryDB), Amazon Managed Streaming for Apache Kafka (Amazon MSK), Amazon Redshift, and AWS Transfer Family resource types. For more informati on, see Supported Resource Types.	February 6, 2024
AWS Config updates managed rules	With this release, AWS Config supports the following managed rule: macie-auto-sensitive-data-discovery-check	January 29, 2024

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon AppStream, AWS Key Management Service (AWS KMS), Amazon Relational Database Service (Amazon RDS), Amazon Cognito, Amazon Elastic Compute Cloud (Amazon EC2), EC2 Image Builder, AWS Ground Station, AWS Mainframe Modernization, Amazon Quick, Amazon Redshift, and AWS Systems Manager resource types. For more information, see Supported Resource Types.	January 3, 2024
Service limits increase for the maximum number of AWS Config Rules per Region per account	With this release, AWS Config supports 1000 AWS Config rules per AWS Region per account. This increase applies to the total of all deployed rules including AWS Config managed rules, AWS Config custom rules, AWS Config conformance packs, AWS Security Hub CSPM controls, AWS Firewall Manager policies, and AWS Backup backup plans per Region per account. For more informati on, see Service Limits.	December 19, 2023

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • s3-meets-restore-time-target • ebs-meets-restore-time-target • ec2-meets-restore-time-target • rds-meets-restore-time-target • efs-meets-restore-time-target • fsx-meets-restore-time-target • aurora-meets-restore-time-target • dynamodb-meets-restore-time-target	December 19, 2023

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for AWS AppConfig, Amazon Managed Service for Prometheus, AWS Database Migration Service (AWS DMS), (AWS Identity and Access Management) IAM, Amazon Managed Streaming for Apache Kafka (Amazon MSK), Amazon CloudWatch Logs, AWS Organizations, and Amazon Simple Storage Service (Amazon S3). For more information, see AWS managed policies for AWS Config.	December 5, 2023

Preview release: Natural language query processor for advanced queries	With this release, you can use the natural language query processor for advanced queries, which uses generative artificial intelligence (generati ve AI) capabilities that allow you to ask questions in plain English and convert them into a ready-to-use query format. With the natural language query processor, you can query your AWS account or across an AWS organizat ion. For more information, see Natural language query processor for advanced queries.	November 26, 2023

Periodic recording	With this release, AWS Config supports periodic recording. Periodic recording provides you with the ability to capture the latest configuration changes for your resources over a fixed period of time. You can now set the default frequency for the configuration recorder to Daily, allowing you to receive a configuration item (CI) representing the most recent state of your resources over the last 24-hour period, only if it's different from the previous CI recorded. The AWS Config console also introduces a new recording strategy experience, where you can also override the recording frequency for specific resource types or exclude specific resource types from recording. This can help make your settings fit your granular requirements. The following data types are added: • RecordingMode • RecordingModeOverride The following data types are updated:	November 26, 2023

- PutConfigurationRecorder
- ConfigurationRecorder
- BaseConfigurationItem
- ConfigurationItem

The following pages in the developer guide are updated:

- Recoding AWS Resources
- Setting up AWS Config with the AWS Config Console | 1-click setup
- Setting up AWS Config with the AWS Config Console | Manual setup
- Setting up AWS Config with the AWS CLI

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Cognito, Amazon Connect Customer, Amazon EMR, AWS Ground Station, AWS Mainframe Modernization, Amazon MemoryDB, AWS Organizations, Amazon Quick, Amazon Relational Database Service (Amazon RDS), Amazon Redshift, Amazon Route 53, AWS Service Catalog, and AWS Transfer Family. The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy also now add security identifiers (SID) for `AWSConfigServiceRolePolicyStatementID` , `AWSConfigSLRLogStatementID` , `AWSConfigSLRLogEventStatementID` , `AWSConfigSLRApiGatewayStatementID` , and `AWSConfigServiceRolePolicy` policy.	November 17, 2023

	For more information, see AWS managed policies for AWS Config.	
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • acm-pca-root-ca-disabled • dynamodb-table-deletion-protection-enabled • ec2-client-vpn-connection-log-enabled • eks-cluster-log-enabled • emr-block-public-access • fsx-windows-audit-log-configured • fsx-openzfs-copy-tags-enabled • fsx-lustre-copy-tags-to-backups • msk-enhanced-monitoring-enabled • mq-auto-minor-version-upgrade-enabled • neptune-cluster-multi-az-enabled • opensearch-update-check • s3-access-point-in-vpc-only • s3-access-point-public-access-blocks • s3-bucket-mfa-delete-enabled	November 9, 2023

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new AWS Identity and Access Management (IAM), AWS Network Manager, AWS Private Certificate Authority (AWS Private CA), AWS App Mesh, Connect Customer, Amazon Elastic Compute Cloud (Amazon EC2), Amazon Elastic Container Service (Amazon ECS), AWS IoT, AWS IoT TwinMaker, Amazon Managed Streaming for Apache Kafka Connect (Amazon MSK Connect), AWS Lambda, and AWS Resource Explorer resource types. For more information, see Supported Resource Types.	November 3, 2023
AWS Config supports new conformance packs	With this release, AWS Config updates the following conformance pack: Operational Best Practices for BNM RMiT	October 26, 2023

Compliance and Inventory Dashboards for Aggregators	With this release, AWS Config adds a compliance dashboard page and an inventory dashboard page to the aggregated view in the AWS Config console. For the compliance dashboard page, you can view automated dashboards with widgets that summarize insights on resource compliance within your aggregator, such as Top 10 resource types by noncompliant resources, Top 10 account level conformance packs by noncompliant rules, and more. For the inventory dashboard page, you can view automated dashboard with widgets that summarize insights on resource configuration data within your aggregator, such as Top 10 resource types by resource count, Top 10 accounts by resource count, and more. For information on the graph and charts, see Compliance dashboard and Inventory dashboard.	October 23, 2023

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for AWS Private CA, AWS App Mesh, Connect Customer, Amazon Elastic Container Service (Amazon ECS), Amazon CloudWatch Evidently, Amazon Managed Grafana, Amazon GuardDuty, Amazon Inspector, AWS IoT, AWS IoT TwinMaker, Amazon Managed Streaming for Apache Kafka (Amazon MSK), AWS Lambda, AWS Network Manager, AWS Organizations, and Amazon SageMaker AI. For more information, see AWS managed policies for AWS Config.	October 4, 2023
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new AWS IoT, AWS IoT TwinMaker, AWS IoT Wireless, Amazon Personalize Amazon Managed Streaming for Apache Kafka (Amazon MSK), Amazon SageMaker AI, AWS CodeBuild, Amazon AppStream, and Amazon Inspector resource types. For more information, see Supported Resource Types.	October 4, 2023

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • docdb-cluster-deletion-protection-enabled • docdb-cluster-audit-logging-enabled • docdb-cluster-snapshot-public-prohibited • mq-active-deployment-mode • mq-rabbit-deployment-mode • dms-auto-minor-version-upgrade-check • dms-replication-task-target db-logging • dms-replication-task-source db-logging • dms-endpoint-ssl-configured • custom-eventbus-policy-attached • global-endpoint-event-replication-enabled • route53-query-logging-enabled • rds-aurora-mysql-audit-logging-enabled • rds-cluster-auto-minor-version-upgrade-enable • appsync-authorization-check	September 21, 2023

	• netfw-deletion-protection-enabled • wafv2-rulegroup-logging-enabled • msk-in-cluster-node-require-tls	
AWS Config supports new conformance packs	With this release, AWS Config updates the following conformance packs: • Operational Best Practices for Amazon S3 • Operational Best Practices for EC2	September 8, 2023
Security IAM update	The `AWSConfigServiceRolePolicy` policy now removes permissions for AWS Systems Manager (Systems Manager). For more information, see AWS managed policies for AWS Config.	September 6, 2023
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon CodeGuru Profiler, AWS Elemental MediaConnect, AWS Transfer Family, Amazon Managed Service for Prometheus, AWS Batch, AWS Cloud Map, and Amazon Route 53 Resolver resource types. For more information, see Supported Resource Types.	September 6, 2023

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • athena-workgroup-encrypted-at-rest • neptune-cluster-iam-database-authentication • neptune-cluster-copy-tags-to-snapshot-enabled • neptune-cluster-cloudwatch-log-export-enabled • neptune-cluster-deletion-protection-enabled • neptune-cluster-snapshot-encrypted • neptune-cluster-backup-retention-check • neptune-cluster-encrypted • neptune-cluster-snapshot-public-prohibited • docdb-cluster-backup-retention-check • docdb-cluster-encrypted • rds-cluster-encrypted-at-rest	August 10, 2023

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new AWS Amplify, Amazon AppIntegrations, AWS App Mesh, Amazon Athena, Amazon Elastic Compute Cloud (Amazon EC2), Amazon CloudWatch Evidently, Amazon Forecast, AWS IoT Greengrass Version 2, AWS Ground Station, AWS Elemental MediaConvert, AWS Elemental MediaTailor, Amazon Managed Streaming for Apache Kafka (Amazon MSK), Amazon Personalize, Amazon Pinpoint, and AWS Resilience Hub resource types. For more information, see Supported Resource Types.	August 3, 2023

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Managed Workflows for AWS App Mesh, Amazon WorkSpaces Applications, AWS CloudFormation, Amazon CloudFront AWS CodeArtifact, AWS CodeBuild, Amazon Connect Customer, AWS Glue, Amazon GuardDuty, AWS Identity and Access Management (IAM), Amazon Inspector, AWS IoT, AWS IoT TwinMaker, AWS IoT Wireless, Amazon Managed Streaming for Apache Kafka, Amazon Macie, AWS Elemental MediaConnect, AWS Network Manager, AWS Organizations, AWS Resource Explorer, Amazon Route 53, Amazon Simple Storage Service (Amazon S3), Amazon Simple Notification Service (Amazon SNS), and Amazon EC2 Systems Manager (SSM). For more information, see AWS managed policies for AWS Config.	July 28, 2023

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon Kinesis, Amazon Elastic Compute Cloud (Amazon EC2), Amazon Pinpoint, Amazon Simple Storage Service (Amazon S3), Amazon Virtual Private Cloud (Amazon VPC), Amazon Kendra, Amazon Connect Customer, AWS CloudFormation, AWS AppConfig, AWS App Mesh, AWS App Runner, and AWS Database Migration Service (AWS DMS) resource types. For more information, see Supported Resource Types.	July 10, 2023
Service limits increase for organization conformance packs	With this release, AWS Config supports 350 AWS Config rules per region per account across all conformance packs and 350 organizational AWS Config rules per organization. For more information, see Service Limits.	June 13, 2023

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Managed Workflows for AWS Amplify, Amazon Connect Customer, AWS App Mesh, Amazon Managed Service for Prometheus, Amazon Athena, AWS Batch, AWS CloudFormation, AWS CloudTrail, AWS CodeArtifact, Amazon CodeGuru, AWS Directory Service, Amazon DynamoDB, Amazon Elastic Compute Cloud (Amazon EC2), Amazon CloudWatch Evidently, Amazon Forecast, AWS Organizations, AWS IoT Greengrass, AWS Ground Station, AWS Identity and Access Management (IAM), Amazon Managed Streaming for Apache Kafka(Amazon MSK), Amazon Lightsail, Amazon CloudWatch Logs, AWS Elemental MediaConnect, AWS Elemental MediaTailor, Amazon Pinpoint, Amazon Virtual Private Cloud (Amazon VPC), Amazon Personalize, Amazon Quick, AWS Migration Hub Refactor Spaces, Amazon Simple Storage Service (Amazon	June 13, 2023

S3), Amazon SageMaker AI, and AWS Transfer Family. For more information, see AWS managed policies for AWS Config.

AWS Config Recording Exclusions by Resource Type	With this release, AWS Config allows you to exclude specific types of AWS resources from inventory tracking and compliance monitoring while still tracking all other supported resource types currently available in AWS Config, including those that will be added in the future. You can use this feature to concentrate on critical resources that are subject to your compliance and governance standards. The updates to the API for the configuration recorder and recording group are backward compatible, meaning that they work with previous versions of the PutConfigurationRecorder API. You can continue to manage which resource types are recorded in the exact same way as before without using the updated or new APIs. The following data types are added: • RecordingStrategy • ExclusionByResourceTypes The following data types are updated:	June 9, 2023

	• PutConfigurationRecorder • ConfigurationRecorder • RecordingGroup The following page in the developer guide is updated: • Selecting Which Resources are Recorded	
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon Elastic Container Service (Amazon ECS), Amazon Keyspaces (for Apache Cassandra) (Amazon Keyspaces), AWS Signer, AWS Amplify, AWS App Mesh, AWS App Runner, Amazon WorkSpaces Applications, AWS CodeArtifact, Amazon Elastic Compute Cloud (Amazon EC2), Amazon CloudWatch Evidently, Amazon Forecast, AWS Identity and Access Management (IAM), Amazon Pinpoint, Amazon SageMaker AI, AWS Transfer Family, Amazon Data Firehose resource types. For more information, see Supported Resource Types.	June 5, 2023

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • cloudfront-s3-origin-access-control-enabled • custom-schema-registry-policy-attached • ec2-client-vpn-not-authorize-all • elasticache-supported-engine-version • macie-status-check • mq-automatic-minor-version-upgrade-enabled • mq-cloudwatch-audit-logging-enabled • netfw-logging-enabled • opensearch-encrypted-at-res • step-functions-state-machine-logging-enabled	May 10, 2023

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon Route 53 Resolver, Amazon Elastic Compute Cloud (Amazon EC2), AWS IoT Wireless, AWS Network Manager, AWS Device Farm, AWS Ground Station, Amazon AppFlow, Amazon Redshift, Amazon Pinpoint, AWS IoT, AWS AppConfig, EC2 Image Builder, Amazon CloudWatch, AWS Panorama, Amazon SageMaker Runtime, Amazon ECR, and AWS Audit Manager resource types. For more information, see Supported Resource Types.	May 5, 2023
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to `AWS::NetworkFirewall::TLSInspectionConfiguration`. For more information, see Supported Resource Types.	May 1, 2023

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Managed Workflows for AWS Amplify, AWS App Mesh, AWS App Runner, Amazon CloudFront, AWS CodeArtifact, Amazon Elastic Compute Cloud, Amazon Kendra, Amazon Macie, Amazon Route 53, Amazon SageMaker AI, AWS Transfer Family, Amazon Pinpoint, AWS Migration Hub, AWS Resilience Hub, Amazon CloudWatch, AWS Directory Service, and AWS WAF. For more information, see AWS managed policies for AWS Config.	April 13, 2023

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • elasticache-auto-minor-version-upgrade-check • elasticache-repl-grp-auto-failover-enabled • elasticache-repl-grp-encrypted-at-rest • elasticache-repl-grp-encrypted-in-transit • elasticache-repl-grp-redis-auth-enabled • elasticache-subnet-group-check • cloudfront-s3-origin-non-existent-bucket	April 10, 2023
Service limits increase for organization conformance packs	With this release, AWS Config supports 350 AWS Config rules per account across all organization conformance packs. For more information, see Service Limits.	April 3, 2023

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • acm-certificate-rsa-check • appsync-associated-with-waf • appsync-logging-enabled • elasticache-rbac-auth-enabled • mq-no-public-access • netfw-multi-az-enabled • ses-malware-scanning-enabled • eks-cluster-logging-enabled • appsync-cache-encryption-at-rest	April 3, 2023

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon WorkSpace s Applications, AWS Auto Scaling, Connect Customer Amazon Elastic Compute Cloud, Amazon EventBrid ge, HealthLake, Kinesis video stream, AWS IoT TwinMaker, Lookout for Vision, Network Manager, Amazon Pinpoint, Amazon Application Recovery Controller (ARC), and AWS RoboMaker resource types. For more information, see Supported Resource Types.	April 3, 2023

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Managed Workflows for Amazon AppFlow, AWS App Runner, Amazon WorkSpaces Applications, AWS CloudFormation, Amazon CloudFront, Amazon CloudWatch, AWS CodeArtifact, AWS CodeCommit, AWS Device Farm, Amazon Elastic Compute Cloud (Amazon EC2), Amazon CloudWatch Evidently, Amazon Forecast, AWS Ground Station, AWS Identity and Access Management (IAM), AWS IoT, Amazon MemoryDB, Amazon Pinpoint, AWS Network Manager, AWS Panorama, Amazon Relational Database Service (Amazon RDS), Amazon Redshift, and Amazon SageMaker AI. For more information, see AWS managed policies for AWS Config.	March 30, 2023

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for AWS Audit Manager. For more information, see AWS managed policies for AWS Config.	March 3, 2023
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new AWS Elemental MediaPackage, Amazon EventBridge, AWS IoT, (Amazon Simple Storage Service (Amazon S3), Amazon Elastic Compute Cloud (Amazon EC2), Amazon Lookout for Metrics, Amazon Lex, AWS Budgets, AWS Device Farm, Amazon CodeGuru Reviewer, Amazon Route 53 Resolver, and AWS RoboMaker resource types. For more information, see Supported Resource Types.	March 2, 2023
Security IAM update	AWS Config now tracks changes to the `AWSConfigMultiAccountSetupPolicy` policy. For more information, see AWS managed policies for AWS Config.	February 27, 2023

AWS Config Resource Coverage by Region Availability	With this release, AWS Config provides Region information for each supported resource type. For information on which resource types are supported in which Regions, see Resource Coverage by Region Availability.	February 20, 2023
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon Interactive Video Service (Amazon IVS), Amazon Simple Storage Service (Amazon S3), AWS Glue, Amazon Elastic Kubernetes Service (Amazon EKS), AWS IoT, Amazon Relational Database Service (Amazon RDS), and Managed Service for Apache Flink resource types. For more information, see Supported Resource Types.	February 7, 2023

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Managed Workflows for Apache Airflow, AWS IoT, Amazon WorkSpaces Applications, Amazon CodeGuru Reviewer, AWS HealthLake, Amazon Kinesis Video Streams, Amazon Application Recovery Controller (ARC), AWS Device Farm, Amazon Elastic Compute Cloud (Amazon EC2), Amazon Pinpoint, AWS Identity and Access Management (IAM), Amazon GuardDuty, and Amazon CloudWatch Logs. For more information, see AWS managed policies for AWS Config.	February 1, 2023
Security IAM update	As a security best practice, the `ConfigConformsServiceRolePolicy` policy now removes broad resource-level permission for `config:DescribeConfigRules` . For more information, see AWS managed policies for AWS Config.	January 12, 2023

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Managed Service for Prometheus, AWS Audit Manager, AWS Device Farm, AWS Database Migration Service (AWS DMS), AWS Directory Service, Amazon Elastic Compute Cloud (Amazon EC2), AWS Glue, AWS IoT, Amazon Lightsail , AWS Elemental MediaPackage, AWS Network Manager, Amazon Quick, AWS Resource Access Manager, Amazon Application Recovery Controller (ARC), Amazon Simple Storage Service (Amazon S3), and Amazon Timestream. For more information, see AWS managed policies for AWS Config.	January 10, 2023

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon MQ, AWS AppConfig, AWS Cloud9, Amazon EventBridge schemas, Amazon Fraud Detector, AWS IoT, AWS IoT Analytics, Amazon Lightsail, AWS Elemental MediaPackage (MediaPackage), Amazon Application Recovery Controller (ARC), AWS Resilience Hub, and AWS Transfer Family resource types. For more information, see Supported Resource Types.	January 5, 2023
AWS Config rule resource coverage	With this release, AWS Config displays the resource type coverage for an increased number of AWS Config managed rules.	December 21, 2022
AWS Config rule discoverability	With this release, AWS Config supports pages for List of AWS Config Managed Rules by Evaluation Mode, List of AWS Config Managed Rules by Trigger Type, and List of AWS Config Managed Rules by Region Availability.	December 21, 2022

AWS Config supports new conformance packs	With this release, AWS Config updates the following conformance packs: • Operational Best Practices for K-ISMS • Operational Best Practices for NIST 800 171 • Operational Best Practices for PCI DSS 3.2.1 • Operational Best Practices for Esquema Nacional de Seguridad (ENS) High • Operational Best Practices for Esquema Nacional de Seguridad (ENS) Medium • Operational Best Practices for Esquema Nacional de Seguridad (ENS) Low • Operational Best Practices for NZISM • Operational Best Practices for NIST 800-53 rev 5	December 19, 2022

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • api-gwv2-access-logs-enabled • api-gwv2-authorization-type-configured • cloudfront-security-policy-check • ec2-launch-template-public-ip-disabled • elastic-beanstalk-logs-to-cloudwatch • sagemaker-notebook-instance-inside-vpc • sagemaker-notebook-instance-root-access-check • security-account-information-provided • storagegateway-resources-protected-by-backup-plan • wafv2-rulegroup-not-empty • wafv2-webacl-not-empty	December 9, 2022

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon CloudWatch RUM, Amazon EventBridge, Amazon GuardDuty, Amazon Simple Email Service (Amazon SES), AWS Backup, AWS DataSync, and AWS Fault Injection Service (AWS FIS) resource types. For more informati on, see Supported Resource Types.	December 9, 2022

AWS Config Proactive Compliance	With this release, AWS Config supports the ability to proactively check for compliance with AWS Config rules before resource provisioning. This allows you to evaluate the configuration settings of your resources before they are created or updated. Use AWS Config to track the configuration changes made to your resources, either pre-provisioning or post-provisioning, and check if your resources match your desired configurations. The following data types are added: • GetResourceEvaluationSummary • StartResourceEvaluation • ListResourceEvaluations The following data types are updated: • DescribeConfigRulesFilters • GetComplianceDetailsByResource • EvaluationResultQualifier • EvaluationModeConfiguration	November 28, 2022

The following pages in the developer guide are updated:

- Components of an AWS Config Rule
- Evaluation Mode and Trigger Types for AWS Config Rules
- AWS Config Managed Rules
- AWS Config Custom Rules
- Managing Your AWS Config Rules

Drift Detection as Configuration Item (CI) for the AWS Config Configuration Recorder	With this release, AWS Config tracks all changes to the configuration recorder to indicate if the state of the configuration recorder differs, or has *drifted*, from its previous state; for example, if there are updates to resource types that you have enabled AWS Config to track, if you have stopped or started the configuration recorder, or if you have deleted or uninstalled the configuration recorder. The `AWS::Config::ConfigurationRecorder` resource type is a system resource type of AWS Config and recording of this resource type is enabled by default in all supported Regions. Recording for the `AWS::Config::ConfigurationRecorder` resource type comes with no additional charge. For more information, see Drift Detection for the Configuration Recorder.	November 18, 2022

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new AWS IoT Events, AWS Cloud Map, EC2 Image Builder, AWS DataSync, AWS Glue, Amazon Application Recovery Controller (ARC), and Amazon Elastic Container Registry (Amazon ECR) resource types. For more information, see Supported Resource Types.	November 8, 2022
Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for AWS CloudFormation. For more information, see AWS managed policies for AWS Config.	November 7, 2022

AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • Operational Best Practices for Criminal Justice Information Services (CJIS) • Security Best Practices for Amazon SageMaker AI • Security Best Practices for Amazon Elastic Container Registry The following conformance packs are updated: • Operational Best Practices for MAS TRMG • Operational Best Practices for NCSC Cyber Assesment Framework • Operational Best Practices for NCSC Cloud Security Principles	October 27, 2022

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for AWS Certificate Manager, Amazon Managed Workflows for Apache Airflow, AWS Amplify, AWS AppConfig, Amazon Keyspaces, Amazon CloudWatch, Connect Customer, AWS Glue DataBrew, Amazon Elastic Compute Cloud (Amazon EC2), Amazon Elastic Kubernetes Service (Amazon EKS), Amazon EventBridge, AWS Fault Injection Service, Amazon Fraud Detector, Amazon FSx, Amazon GameLift Servers, Amazon Location Service, AWS IoT, Amazon Lex, Amazon Lightsail, Amazon Pinpoint, OpsWorks, AWS Panorama, AWS Resource Access Manager, Amazon Quick, Amazon Relational Database Service (Amazon RDS), Amazon Rekognition, AWS RoboMaker, AWS Resource Groups, Amazon Route 53, Amazon Simple Storage Service (Amazon S3), AWS Cloud Map, and AWS Security Token Service. For	October 19, 2022

	more information, see AWS managed policies for AWS Config.	
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon Elastic Compute Cloud (Amazon EC2), Amazon Simple Email Service (Amazon SES), AWS AppConfig, AWS Cloud Map, and AWS DataSync resource types. For more information, see Supported Resource Types.	October 6, 2022
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon GuardDuty, Amazon SageMaker AI, AWS AppSync, AWS Cloud Map, and AWS DataSync resource types. For more information, see Supported Resource Types.	October 4, 2022
AWS Config supports new conformance pack	With this release, AWS Config updates the Operational Best Practices for SWIFT CSP conformance pack.	October 4, 2022

AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • Operational Best Practices for CMMC 2.0 Level 1 • Operational Best Practices for CMMC 2.0 Level 2 The following conformance packs are updated: • Operational Best Practices for Amazon API Gateway • Operational Best Practices for AWS Well-Architected Framework Reliability Pillar • Operational Best Practices for AWS Well-Architected Framework Security Pillar • Operational Best Practices for CMMC Level 1 • Operational Best Practices for CMMC Level 2 • Operational Best Practices for CMMC Level 3 • Operational Best Practices for CMMC Level 4 • Operational Best Practices for CMMC Level 5 • Operational Best Practices for FFIEC • Operational Best Practices for FedRAMP(Low)	September 30, 2022

	• Operational Best Practices for MAS Notice 655 • Operational Best Practices for NBC TRMG • Operational Best Practices for NIST 800 172	
Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for AWS Glue. For more information, see AWS managed policies for AWS Config.	September 14, 2022
AWS Config supports new conformance pack	With this release, AWS Config supports the Operational Best Practices for SWIFT CSP conformance pack.	September 9, 2022

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon AppFlow, Amazon CloudWatch, Amazon CloudWatch RUM, Amazon CloudWatch Synthetics, Amazon Connect Customer Customer Profiles, Amazon Connect Customer Voice ID, Amazon DevOps Guru, Amazon Elastic Compute Cloud (Amazon EC2), Amazon EC2 Auto Scaling, Amazon EMR, Amazon EventBridge, Amazon EventBridge Schemas, Amazon FinSpace, Amazon Fraud Detector, Amazon GameLift Servers, Amazon Interactive Video Service (Amazon IVS), Amazon Managed Service for Apache Flink, EC2 Image Builder, Amazon Lex, Amazon Lightsail, Amazon Location Service, Amazon Lookout for Equipment, Amazon Lookout for Metrics, Amazon Lookout for Vision, Amazon Managed Blockchain, Amazon MQ, Amazon Nimble StudioAmazon Pinpoint, Amazon Quick, Amazon Application Recovery Controller (ARC),	September 7, 2022

Amazon Route 53 Resolver, Amazon Simple Storage Service (Amazon S3), Amazon SimpleDB, Amazon Simple Email Service (Amazon SES), Amazon Timestream, AWS AppConfig, AWS AppSync, AWS Auto Scaling, AWS Backup, AWS Budgets, AWS Cost Explorer, AWS Cloud9, AWS Directory Service, AWS DataSync, AWS Elemental MediaPackage, AWS Glue, AWS IoT, AWS IoT Analytics , AWS IoT Events, AWS IoT SiteWise, AWS IoT TwinMaker , AWS Lake Formation, AWS License Manager, AWS Resilience Hub, AWS Signer, and AWS Transfer Family. For more information, see AWS managed policies for AWS Config.

AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • Operational Best Practices for Amazon CloudWatch • Operational Best Practices for Germany Cloud Computing Compliance Controls Catalog (C5) • Operational Best Practices for IRS 1075 The following conformance packs are updated: • AWS Control Tower Detective Guardrails Conformance Pack • Operational Best Practices for CISA Cyber Essentials • Operational Best Practices for ENISA Cybersecurity guide for SMEs • Operational Best Practices for FDA Title 21 CFR Part 11 • Operational Best Practices for FedRAMP(Moderate) • Operational Best Practices for HIPAA Security • Operational Best Practices for NIST Privacy Framework v1.0 • Operational Best Practices for NYDFS 23	August 31, 2022

	• Operational Best Practices for RBI Cyber Security Framework for UCBs • Operational Best Practices for RBI MD-ITF	
Getting Started with AWS Config and Custom Conformance Pack updates	With this release, AWS Config updates the Getting Started with AWS Config and Setting Up AWS Config with the Console pages, introducing a 1-click setup and Manual setup page. AWS Config also updates the Custom Conformance Pack page with a walkthrough on how to create a conformance pack YAML file from scratch.	August 25, 2022

AWS Systems Manager Document (SSM document) Integration with Conformance Packs	With this release, you can create a conformance pack template with an SSM document. For more informati on on SSM documents, see AWS Systems Manager Documents in the AWS Systems Manager User Guide. The following data types are updated: • PutConformancePack • ConformancePackDetail • TemplateSSMDocumen tDetails The following pages in the developer guide are updated: • Deploying a Conformance Pack Using the AWS Config Console • Deploying a Conforman ce Pack Using the AWS Command Line Interface	August 24, 2022

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Simple Email Service (Amazon SES), AWS DataSync, and AWS Cloud Map. For more information, see AWS managed policies for AWS Config.	August 22, 2022
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon Athena, Amazon Detective, Amazon SageMaker AI, Amazon Route 53, AWS Database Migration Service (AWS DMS), AWS Glue, AWS Key Management Service (AWS KMS), and Amazon Simple Email Service (Amazon SES) resource types. For more information, see Supported Resource Types.	August 16, 2022

AWS Config supports new conformance packs	With this release, AWS Config updates the following conformance packs: • Operational Best Practices for NIST 1800 25 • Operational Best Practices for NIST 800 181 • Operational Best Practices for ABS CCIG 2.0 Standard Workloads • Operational Best Practices for ABS CCIG 2.0 Material Workloads • Operational Best Practices for ACSC Essential 8 • Operational Best Practices for ACSC ISM • Operational Best Practices for APRA CPG 234 • Operational Best Practices for CIS AWS Foundations Benchmark v1.4 Level 1 • Operational Best Practices for CIS AWS Foundations Benchmark v1.4 Level 2 • Operational Best Practices for BNM RMiT • Operational Best Practices for NIST CSF	August 1, 2022

Compliance score for conformance packs	With this release, AWS Config introduces compliance score for conformance packs, which provides you with a high-level view of the compliance state of your conformance packs. You can use it to identify, investigate, and understand the level of compliance in your conformance packs. A compliance score is the percentage of the number of compliant rule-resource combinations in a conformance pack compared to the number of total possible rule-resource combinations in the conformance pack. The following data types are updated: • ListConformancePackComplianceScores • ConformancePackComplianceScore The following pages in the developer guide are updated: • Viewing the AWS Config Dashboard • Viewing Compliance Data in the Conformance Packs Dashboard	July 26, 2022

	• Managing Conformance Packs (API)	
Security IAM update	The `ConfigConformsServiceRolePolicy` policy now grants permission to publish metric data points to Amazon CloudWatch. For more information, see AWS managed policies for AWS Config.	July 25, 2022

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Elastic Container Service (Amazon ECS), Amazon ElastiCache, Amazon EventBridge, Amazon FSx, Amazon Managed Service for Apache Flink, Amazon Location Service, Amazon Managed Streaming for Apache Kafka, Amazon Quick, Amazon Rekognition, AWS RoboMaker, Amazon Simple Storage Service (Amazon S3), Amazon Simple Email Service (Amazon SES), AWS Amplify, AWS AppConfig, AWS AppSync, AWS Billing Conductor, AWS DataSync, AWS Firewall Manager, AWS Glue, AWS IAM Identity Center (IAM Identity Center), EC2 Image Builder, and Elastic Load Balancing. For more information, see AWS managed policies for AWS Config.	July 15, 2022

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon Elastic Compute Cloud (Amazon EC2) resource types. For more informati on, see Supported Resource Types.	July 8, 2022
AWS Config supports new resources type	With this release, you can use AWS Config to record configuration changes to new AWS Global Accelerat or resource types. For more information, see Supported Resource Types.	July 5, 2022
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • autoscaling-launch-template • ecs-task-definition-log-con figuration • ecs-awsvpc-networking-enabled	July 1, 2022

AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • Operational Best Practices for Canadian Centre for Cyber Security (CCCS) Medium Cloud Control Profile • Operational Best Practices for Gramm Leach Bliley Act (GLBA) • Operational Best Practices for GxP EU Annex 11 • Security Best Practices for Amazon Elastic Kubernetes Service (Amazon EKS) • Security Best Practices for Amazon Relational Database Service (Amazon RDS) • Security Best Practices for AWS Lambda The following conformance packs are updated: • Operational Best Practices for AI and ML • Operational Best Practices for Amazon DynamoDB • Operational Best Practices for CIS Critical Security Controls v8 IG1	June 30, 2022

	• Operational Best Practices for CIS Critical Security Controls v8 IG2 • Operational Best Practices for CIS Critical Security Controls v8 IG3 • Operational Best Practices for HIPAA Security • Operational Best Practices for NIST 800-53 rev 5 • Operational Best Practices for NIST CSF	
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon SageMaker AI resource types. For more information, see Supported Resource Types.	June 29, 2022

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon Managed Streaming for Apache Kafka (Amazon MSK), Amazon Route 53, Amazon WorkSpaces, AWS Batch, AWS Identity and Access Management Access Analyzer (IAM Access Analyzer), AWS Database Migration Service (AWS DMS), AWS Step Functions, and Elastic Load Balancing resource types. For more information, see Supported Resource Types.	June 14, 2022

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • aurora-last-backup-recovery-point-created • dynamodb-last-backup-recovery-point-created • ebs-last-backup-recovery-point-created • ec2-last-backup-recovery-point-created • efs-last-backup-recovery-point-created • fsx-last-backup-recovery-point-created • rds-last-backup-recovery-point-created • s3-last-backup-recovery-point-created • storagegateway-last-backup-recovery-point-created • virtualmachine-last-backup-recovery-point-created	June 13, 2022

AWS Config Integration with AWS Security Hub CSPM	With this release, you can see the results of AWS Config managed and custom rule evaluations as findings in AWS Security Hub CSPM. Security Hub CSPM transforms rule evaluations into findings, which provide more information about the impacted resources, such as the Amazon Resource Name (ARN) and creation date. These findings can be viewed alongside other Security Hub CSPM findings, providing a comprehensive overview of your security posture. For more information, see Sending Rule Evaluations to Security Hub CSPM	June 7, 2022
Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for Amazon Athena, Amazon Detective, Amazon GuardDuty, Amazon Macie, Amazon Simple Email Service (Amazon SES), AWS Glue, AWS Resource Access Manager (AWS RAM), and AWS IAM Identity Center. For more information, see AWS managed policies for AWS Config.	May 31, 2022

AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • Security Best Practices for Amazon Elastic Container Service (Amazon ECS) • Security Best Practices for Amazon Elastic File System (Amazon EFS) • Security Best Practices for Amazon CloudFront • Security Best Practices for AWS Auto Scaling • Security Best Practices for AWS Network Firewall • Security Best Practices for AWS Secrets Manager	May 31, 2022
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon SageMaker AI and AWS Step Functions resource types. For more informati on, see Supported Resource Types.	May 26, 2022
AWS Config supports new conformance pack	With this release, AWS Config updates the Operational Best Practices for NERC CIP BCSI conformance pack.	May 20, 2022

Components of an AWS Config Rule	With this release, AWS Config introduces a Components of an AWS Config Rule page. The page discusses the structure of rule definitions, rule metadata, and best practices on how to write rules with Python using the AWS Config Rules Development Kit (RDK) and AWS Config Rules Development Kit Library (RDKlib).	May 9, 2022
Service limits increase for organization conformance packs	With this release, AWS Config supports 180 AWS Config rules per account across all organization conformance packs. For more information, see Service Limits.	May 6, 2022
AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • Security Best Practices for Amazon OpenSearch Service • Security Best Practices for Amazon Redshift • Security Best Practices for AWS CloudTrail • Security Best Practices for AWS CodeBuild • Security Best Practices for AWS WAF	April 29, 2022

AWS Config updates managed rule	With this release, AWS Config supports the s3-resources-protected-by-backup-plan managed rule.	April 11, 2022
Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions to get information about all or a specified AWS CloudTrail event data store (EDS), get information about all or a specified AWS CloudFormation resource, get a list of a DynamoDB Accelerator (DAX) parameter group or subnet group, get information about AWS Database Migration Service (AWS DMS) replication tasks for your account in the current region being accessed, and get a list all policies in an AWS Organizations of a specified type. For more information, see AWS managed policies for AWS Config.	April 7, 2022

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • alb-desync-mode-check • autoscaling-capacity-rebalancing • autoscaling-launchconfig-requires-imdsv2 • autoscaling-launch-config-hop-limit • autoscaling-multiple-instance-types • clb-desync-mode-check • ecs-container-insights-enabled • ecs-fargate-latest-platform-version • netfw-policy-default-action-fragment-packets • netfw-policy-default-action-full-packets • netfw-policy-rule-group-associated • redshift-audit-logging-enabled • s3-lifecycle-policy-check • waf-regional-rule-not-empty • waf-regional-rulegroup-not-empty • waf-regional-webacl-not-empty	April 4, 2022

- vpc-peering-dns-resolution-check

AWS Config Custom Policy rules	With this release, AWS Config allows you to create AWS Config Custom Policy rules using AWS CloudFormation Guard (guard). Guard is a policy-as-code language that allows you to write policies that are enforced by AWS Config without the need to create Lambda functions to manage your custom rules. Rules written using Guard policy can be created from the AWS Config console or by using the AWS Config rule APIs. The following pages in the developer guide are updated: • AWS Config Custom Rules • Creating AWS Config Custom Rules with Guard The following data types are updated: • Source • CustomPolicyDetails • ConfigRuleEvaluationStatus • GetCustomRulePolicy • GetOrganizationCustomRulePolicy • OrganizationCustomPolicyRuleMetadata	April 4, 2022

AWS Config supports new resources type	With this release, you can use AWS Config to record configuration changes to the new Amazon EMR SecurityC onfiguration resource type. For more information, see Supported Resource Types.	March 31, 2022
AWS Config updates managed rule	With this release, AWS Config supports the virtualmachine-resources-protected-by-backup-plan managed rule.	March 29, 2022

AWS Config Integration with Amazon CloudWatch Metrics	With this release, AWS Config now supports tracking of your AWS Config usage and success metrics with Amazon CloudWatch in the AWS Config Dashboard page. CloudWatch metrics is a monitoring service which provides data about the performance of your systems, including the ability to search, graph, and build alarms on metrics about AWS resources . From the AWS Config Dashboard, you can see what traffic is driving your AWS Config usage and key metrics for failures that have occured in your workflow. The following page is updated: • Viewing the AWS Config Dashboard	March 29, 2022
AWS Config supports new resources type	With this release, you can use AWS Config to record configuration changes to new Amazon GuardDuty Detector resource type. For more information, see Supported Resource Types.	March 24, 2022

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • clb-multiple-az • cloudfront-no-deprecated-ssl-protocols • cloudfront-traffic-to-origin-encrypted • cloudwatch-alarm-action-enabled-check • ec2-no-amazon-key-pair • ec2-paravirtual-instance-check • ec2-token-hop-limit-check • ec2-transit-gateway-auto-vpc-attach-disabled • ecr-private-lifecycle-policy-configured • efs-access-point-enforce-root-directory • efs-access-point-enforce-user-identity • elbv2-multiple-az • kinesis-stream-encrypted • redshift-default-db-name-check • s3-event-notifications-enabled • sns-topic-message-delivery-notification-enabled	March 23, 2022

	• waf-global-rulegroup-not-empty • waf-global-rule-not-empty	
AWS Config supports new conformance packs	With this release, AWS Config updates the following conformance packs: • Operational Best Practices for CIS Critical Security Controls v8 IG1 • Operational Best Practices for CIS Critical Security Controls v8 IG2 • Operational Best Practices for CIS Critical Security Controls v8 IG3 • Operational Best Practices for AWS Well-Architected Framework Security Pillar • Operational Best Practices for Esquema Nacional de Seguridad (ENS) Low • Operational Best Practices for Esquema Nacional de Seguridad (ENS) Medium • Operational Best Practices for Esquema Nacional de Seguridad (ENS) High • Operational Best Practices for MAS Notice 655 • Operational Best Practices for NIST 1800-25	March 16, 2022

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant additional permissions for AWS CloudFormation. For more information, see AWS managed policies for AWS Config.	March 14, 2022
AWS Config updates managed rules	With this release, AWS Config updates the following managed rules: • aurora-resources-protected-by-backup-plan • dynamodb-resources-protected-by-backup-plan • ebs-resources-protected-by-backup-plan • ec2-resources-protected-by-backup-plan • efs-resources-protected-by-backup-plan • fsx-resources-protected-by-backup-plan • rds-resources-protected-by-backup-plan	March 10, 2022

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon Elastic Container Registry Public resource types. For more informati on, see Supported Resource Types.	March 4, 2022
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon Elastic Compute Cloud resource types. For more information, see Supported Resource Types.	February 28, 2022
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • codedeploy-auto-rollback-monitor-enabled • codedeploy-ec2-minimum-healthy-hosts-configured • codedeploy-lambda-allatonce-traffic-shift-disabled	February 25, 2022

Logging and Monitoring in AWS Config Update	With this release, AWS Config updates the Monitoring AWS Config with Amazon EventBridge Events page to replace references to Amazon CloudWatch Events. Amazon EventBridge is the preferred way to manage your events. CloudWatch Events and EventBridge are the same underlying service and API, but EventBridge provides more features. Changes you make in either CloudWatch or EventBridge will appear in each console. For more informance, see Amazon EventBridge.	February 24, 2022
AWS SDK Page for AWS Config	With this release, AWS Config introduces a Using AWS Config with an AWS SDK page. AWS software development kits (SDKs) are available for many popular programming languages . Each SDK provides an API, code examples, and documentation that make it easier for developers to build applications in their preferred language.	February 24, 2022

Security IAM Role Trust policy update	With this release, AWS Config updates the IAM trust policy statement to include security protections in the trust policy that restrict access with `sourceARN` and/or `sourceAccountId` for the AWS Security Token Service (AWS STS) operation. This helps make sure that the IAM role trust policy is accessing your resources on behalf of expected users and scenarios only. The following page is updated: • Adding an IAM Trust Policy to your Role	February 18, 2022

Changes to Global Resource Type Recording	AWS Config now changes how new global resource types are recorded in AWS Config Recording. Global resource types are AWS resources that do not require you to specify a region at creation. Before this change, you could enable the recording of global resource types in all supported regions in AWS Config. After this change, new global resource types onboarded to AWS Config recording can only be recorded in the service's home region for the commercial partition, and AWS GovCloud (US-West) for the AWS GovCloud (US) partition. You will now be able to view the configuration items for these new global resource types only in their home region and AWS GovCloud (US-West) . For a list of home regions for global resource types onboarded after February 2022, see the table on the Recording All Supported Resource Types page.	February 18, 2022

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant permission to get details about Elastic Beanstalk environments and a description of the settings for the specified Elastic Beanstalk configuration set, get a map of OpenSearch or Elasticsearch versions, describe the available Amazon RDS option groups for a database, and get information about a CodeDeploy deployment configuration. This policy also now grants permission to retrieve the specified alternate contact attached to an AWS account, retrieve information about an AWS Organizations policy, retrieve an Amazon ECR repository policy, retrieve information about an archived AWS Config rule, retrieve a list of Amazon ECS task definition families, list the root or parent organizational units (OUs) of the specified child OU or account, and list the policies that are attached to the specified target root, organizational unit, or account. For more informati	February 10, 2022

on, see AWS managed policies for AWS Config.

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • autoscaling-multiple-az • codebuild-project-artifact-encryption • codebuild-project-environment-privileged-check • codebuild-project-logging-enabled • codebuild-project-s3-logs-encrypted • ec2-security-group-attached-to-eni-periodic • ecr-private-image-scanning-enabled • ecr-private-tag-immutability-enabled • ecs-containers-nonprivileged • ecs-containers-readonly-access • ecs-no-environment-secrets • ecs-task-definition-memory-hard-limit • ecs-task-definition-nonroot-user • ecs-task-definition-pid-mode-check • eks-cluster-oldest-supported-version	February 10, 2022

	• eks-cluster-supported-version • lambda-vpc-multi-az-check • nacl-no-unrestricted-ssh-rdp • netfw-stateless-rule-group-not-empty • rds-cluster-default-admin-check • rds-db-security-group-not-allowed • rds-instance-default-admin-check • redshift-default-admin-check • s3-bucket-acl-prohibited • s3-version-lifecycle-policy-check • waf-global-webacl-not-empty	
Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant permission to create Amazon CloudWatch log groups and streams and to write logs to created log streams. For more information, see AWS managed policies for AWS Config.	February 2, 2022

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • opensearch-access-control-enabled • opensearch-audit-logging-enabled • opensearch-data-node-fault-tolerance • opensearch-encrypted-at-rest • opensearch-https-required • opensearch-in-vpc-only • opensearch-logs-to-cloudwatch • opensearch-node-to-node-encryption-check	January 31, 2022
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to AWS CodeDeploy resource types. For more information, see Supported Resource Types.	January 5, 2022
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon SageMaker AI resource types. For more information, see Supported Resource Types.	December 20, 2021

AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • Operational Best Practices for ENISA Cybersecurity guide for SMEs	December 20, 2021
AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • Operational Best Practices for NIST 800 172 • Operational Best Practices for NIST 800 181 The following conformance pack is updated: • Operational Best Practices for K-ISMS	November 18, 2021

AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • Operational Best Practices for Amazon API Gateway • Operational Best Practices for AWS Backup • Operational Best Practices for CISA Cyber Essentials • Operational Best Practices for DevOps • Operational Best Practices for NIST Privacy Framework v1.0 The following conformance packs are updated: • Operational Best Practices for FedRAMP(Low) • Operational Best Practices for FedRAMP(Moderate)	October 29, 2021
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon OpenSearch Service resource types. For more information, see Supported Resource Types.	October 12, 2021

AWS Config supports new conformance packs	With this release, AWS Config updates the following conformance pack: • Operational Best Practices for MAS TRMG	October 12, 2021

AWS Config supports new conformance packs	With this release, AWS Config updates the following conformance packs: • Operational Best Practices for ABS CCIG 2.0 Material Workloads • Operational Best Practices for ABS CCIG 2.0 Standard Workloads • Operational Best Practices for ACSC Essential 8 • Operational Best Practices for ACSC ISM • Operational Best Practices for BNM RMiT • Operational Best Practices for CMMC Level 1 • Operational Best Practices for CMMC Level 2 • Operational Best Practices for CMMC Level 3 • Operational Best Practices for CMMC Level 4 • Operational Best Practices for CMMC Level 5 • Operational Best Practices for FDA Title 21 CFR Part 11 • Operational Best Practices for FFIEC • Operational Best Practices for MAS Notice 655 • Operational Best Practices for NBC TRMG	September 30, 2021

	• Operational Best Practices for NERC CIP • Operational Best Practices for NIST 800-53 rev 5	
Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant permission to get details about an Amazon OpenSearch Service (OpenSearch Service) domain/domains and to get a detailed parameter list for a particular Amazon Relational Database Service (Amazon RDS) DB parameter group. This policy also grants permission to get details about Amazon ElastiCache snapshots. For more information, see AWS managed policies for AWS Config.	September 8, 2021
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to new Amazon Elastic Compute Cloud resource types. For more information, see Supported Resource Types.	September 7, 2021

AWS Config supports new conformance packs	With this release, AWS Config updates the following conformance packs: • Operational Best Practices for APRA CPG 234 • Operational Best Practices for CIS AWS Foundations Benchmark v1.4 Level 1 • Operational Best Practices for CIS AWS Foundations Benchmark v1.4 Level 2 • Operational Best Practices for NCSC Cloud Security Principles • Operational Best Practices for NCSC Cyber Assesment Framework • Operational Best Practices for NIST 800 171 • Operational Best Practices for NIST CSF • Operational Best Practices for RBI Cyber Security Framework for UCBs • Operational Best Practices for RBI MD-ITF • Operational Best Practices for NYDFS 23 • Operational Best Practices for PCI DSS 3.2.1	August 30, 2021

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • aurora-resources-protected-by-backup-plan • backup-plan-min-frequency-and-min-retention-check • backup-recovery-point-encrypted • backup-recovery-point-manual-deletion-disabled • backup-recovery-point-minimum-retention-check • dynamodb-resources-protected-by-backup-plan • ebs-resources-protected-by-backup-plan • ec2-resources-protected-by-backup-plan • efs-resources-protected-by-backup-plan • fsx-resources-protected-by-backup-plan • rds-resources-protected-by-backup-plan	August 20, 2021
AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance pack: • Operational Best Practices for NZISM	August 20, 2021

Security Amazon SNS policy update	With this release, AWS Config updates the IAM policy statement for the Amazon SNS topic when using service-linked roles to include security protectio ns that restrict access with `sourceARN` and/or `sourceAccountId` in the topic policy. This helps make sure Amazon SNS is accessing your resources on behalf of expected users and scenarios only. The following page is updated: • Permissions for the Amazon SNS Topic	August 17, 2021

Security AWS Lambda policy update	With this release, AWS Config updates the AWS Lambda resource-based policy for AWS Config custom rules to include security protections that restrict access with `sourceARN` and/or `sourceAccountId` in the invoke request. This helps make sure AWS Lambda is accessing your resources on behalf of expected users and scenarios only. The following pages are updated: • AWS::Config::ConfigRule • Developing a Custom Rule for AWS Config	August 12, 2021
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to Amazon Kinesis resource types. For more informati on, see Supported Resource Types.	August 6, 2021

AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance pack: • Operational Best Practices for Esquema Nacional de Seguridad (ENS) High The following conformance packs are updated: • Operational Best Practices for AWS Well-Architected Framework Reliability Pillar • Operational Best Practices for AWS Well-Architected Framework Security Pillar • Operational Best Practices for Esquema Nacional de Seguridad (ENS) Low • Operational Best Practices for Esquema Nacional de Seguridad (ENS) Medium • Operational Best Practices for HIPAA Security	July 30, 2021
Example AWS Lambda Functions for AWS Config Custom Rules	With this release, AWS Config provides Python example functions in Example AWS Lambda Functions for AWS Config Rules (Python).	July 29, 2021

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant permission to list tags for a log group, list tags for a state machine, and list all state machines. These policies now grant permission to get details about a state machine. These policies also now support additional permission for Amazon EC2 Systems Manager (SSM), Amazon Elastic Container Registry, Amazon FSx, Amazon Data Firehose, Amazon Managed Streaming for Apache Kafka (Amazon MSK), Amazon Relational Database Service (Amazon RDS), Amazon Route 53, Amazon SageMaker AI, Amazon Simple Notification Service, AWS Database Migration Service, AWS Global Accelerator, and AWS Storage Gateway. For more information, see AWS managed policies for AWS Config.	July 28, 2021
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to AWS Backup resource types. For more information, see Supported Resource Types.	July 14, 2021

AWS Config supports new conformance packs	With this release, AWS Config supports the following conformance packs: • Operational Best Practices for CIS Critical Security Controls v8 IG1 • Operational Best Practices for CIS Critical Security Controls v8 IG2 • Operational Best Practices for CIS Critical Security Controls v8 IG3 • Operational Best Practices for NIST 1800 25	July 9, 2021
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • ssm-document-not-public • s3-account-level-public-access-blocks-periodic	June 25, 2021
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • ec2-instance-multiple-eni-check • elbv2-acm-certificate-required • autoscaling-launch-config-public-ip-disabled	June 10, 2021

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant permission to view the permissions of AWS Systems Manager documents and information about IAM Access Analyzer. These policies now support additional AWS resource types for Amazon Kinesis, Amazon ElastiCache, Amazon EMR, AWS Network Firewall, Amazon Route 53, and Amazon Relational Database Service (Amazon RDS). These permission changes allow AWS Config to invoke the read-only APIs required to support these resource types. These policies also now support filtering Lambda@Edge functions for the lambda-inside-vpc AWS Config managed rule. For more information, see AWS managed policies for AWS Config.	June 8, 2021

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • elasticsearch-logs-to-cloudwatch • rds-cluster-multi-az-enabled • api-gw-associated-with-waf • iam-policy-no-statements-with-full-access	May 19, 2021
AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to Amazon Elastic File System resource types. For more information, see Supported Resource Types.	May 13, 2021

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grants permission that allow AWS Config to make read-only GET calls to API Gateway to support a Config Rule for API Gateway. These policies also adds permissions that allow AWS Config to invoke Amazon Simple Storage Service (Amazon S3) read-only APIs, which are required to support the new `AWS::S3::AccessPoint` resource type. For more information, see AWS managed policies for AWS Config.	May 10, 2021
AWS Config Custom Rules	The following pages in the developer guide are updated: • Getting Started with Custom Rules for AWS Config • Developing a Custom Rule for AWS Config	April 30, 2021

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • aurora-mysql-backtracking-enabled • ec2-instance-profile-attached • ecs-task-definition-user-for-host-mode-check • no-unrestricted-route-to-igw • rds-automatic-minor-version-upgrade-enabled • redshift-enhanced-vpc-routing-enabled	April 15, 2021

Security IAM update	The `AWSConfigServiceRolePolicy` policy and `AWS_ConfigRole` policy now grant permission to view information about AWS Systems Manager specified documents. These policies also now support additional AWS resource types for AWS Backup, Amazon Elastic File System, Amazon ElastiCache, Amazon Simple Storage Service (Amazon S3), Amazon Elastic Compute Cloud (Amazon EC2), Amazon Kinesis, Amazon SageMaker AI, AWS Database Migration Service, and Amazon Route 53. These permission changes allow AWS Config to invoke the read-only APIs required to support these resource types. For more information, see AWS managed policies for AWS Config.	April 14, 2021

Conformance Pack Compliance as Configuration Items (CIs)	With this release, AWS Config supports conformance pack compliance as configuration items. This enables you to: • View a timeline of changes to the compliance state of your conformance packs • Aggregate conformance packs compliance across multiple accounts and regions • Use advanced queries to check the compliance of your conformance packs The following data types are updated: • DescribeAggregateComplianceByConformancePacks • GetAggregateConformancePackComplianceSummary The following pages in the developer guide are updated: • Viewing Compliance Data in the Conformance Packs Dashboard • Viewing Compliance History Timeline for Conformance Packs	March 30, 2021

	• Viewing Compliance Data in the Aggregator Dashboard • Querying the Current Configuration State of AWS Resources • Supported Resource Types	
Pagination update	With this release, AWS Config advanced queries feature now supports paginatio n for queries that contain aggregate functions, such as COUNT and SUM. You can now use advanced queries to get complete results for your aggregate queries through pagination, which were previously limited to 500 rows. For more informati on, see Querying the Current Configuration State of AWS Resources	March 26, 2021
Region support	With this release, AWS Config and AWS Config Rules is now supported in Asia Pacific (Osaka) Region.	March 4, 2021

AWS Config supports new resources types	With this release, you can use AWS Config to record configuration changes to Amazon Elastic Container Registry, Amazon Elastic Container Service, and Amazon Elastic Kubernete s Service resource types. For more information, see Supported Resource Types.	February 25, 2021
KMS encryption support	With this release, AWS Config allows you to use KMS-based encryption on objects delivered by AWS Config for S3 bucket delivery. The following data types are updated: • DeliveryChannel • PutDeliveryChannel The following pages in the developer guide are updated: • Permissions for the KMS Key • Permissions for the IAM Role Assigned to AWS Config	February 16, 2021

AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • secretsmanager-secret-periodic-rotation • secretsmanager-secret-unused • secretsmanager-using-cmk	February 16, 2021
Saved Query Region support	With this release, saved query is now supported in AWS GovCloud (US-East) and AWS GovCloud (US-West) Regions.	February 15, 2021
Multi-account multi-region data aggregation Region support	With this release, multi-account multi-region data aggregation is now supported in Africa (Cape Town) and Europe (Milan) Regions. For more information, see Multi-Account Multi-Region Data Aggregation.	February 15, 2021
Advanced queries Region support	With this release, advanced queries is now supported in Africa (Cape Town) and Europe (Milan) Regions. For more information, see Querying the Current Configuration State of AWS Resources.	February 15, 2021
AWS Config documentation history notification available through RSS feed	You can now receive notification about updates to the AWS Config documentation by subscribing to an RSS feed.	January 1, 2021

Earlier Updates

The following table describes the documentation release history of AWS Config prior to Dec 31, 2020.

Change	Description	Release Date
Saved Query support	With this release, AWS Config allows you to save your queries. After you save the query, you can search it, copy it to the query editor, edit it, or delete it. For more information about how to save a query, see the Query Using the SQL Query Editor for AWS Config (Console) and Query Using the SQL Query Editor for AWS Config (AWS CLI). For more information about APIs, see the *AWS Config API Reference*: • PutStoredQuery • GetStoredQuery • ListStoredQueries • DeleteStoredQuery Also see Service Limits for AWS Config.	December 21, 2020
Process checks support	With this release, AWS Config supports process checks that is a type of AWS Config rule that allows you to track your external and internal tasks that require verificat ion as part of the conformance packs. With process checks, you can	December 17, 2020

Change	Description	Release Date
	list the compliance of requirements and actions at a single location. For more information about process checks, see the AWS Config Process Checks Within a Conformance Pack for AWS Config topic and the PutExternalEvaluation API.	
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • api-gw-ssl-enabled • api-gw-xray-enabled • beanstalk-enhanced-health-reporting-enabled • cloudfront-accesslogs-enabled • cloudfront-associated-with-waf • cloudfront-custom-ssl-certificate • elastic-beanstalk-managed-updates-enabled • rds-cluster-iam-authentication-enabled • redshift-cluster-kms-enabled • s3-bucket-level-public-access-prohibited • subnet-auto-assign-public-ip-disabled • vpc-network-acl-unused-check	December 17, 2020

Change	Description	Release Date
AWS Config supports AWS Network Firewall	With this release, you can use AWS Config to record configuration changes to your AWS Network Firewall FirewallPolicy, RuleGroup , and Firewall resource types. For more information, see Supported Resource Types for AWS Config.	December 4, 2020
Documentation update	AWS Config added support for organization-wide resource data aggregation in a delegated administrator account. You can now use a delegated administr ator account to aggregate resource configuration and compliance data from all member accounts of an organization in AWS Organizations. For more information, see PutConfig urationAggregator, Creating Aggregators for AWS Config and Registering a Delegated Administr ator for AWS Config.	December 4, 2020

Change	Description	Release Date
AWS Config supports new conformance packs	• Operational Best Practices for Esquema Nacional de Seguridad (ENS) Low • Operational Best Practices for Esquema Nacional de Seguridad (ENS) Medium • Operational Best Practices for NCSC Cyber Assesment Framework • Operational Best Practices for RBI Cyber Security Framework for UCBs	October 30, 2020

Change	Description	Release Date
AWS Config supports new conformance packs	• Operational Best Practices for ACSC Essential 8 • Operational Best Practices for ACSC ISM - Part 1 • Operational Best Practices for AI and ML • Operational Best Practices for Asset Management • Operational Best Practices for BCP and DR • Operational Best Practices for EC2 • Operational Best Practices for K-ISMS • Operational Best Practices for Load Balancing • Operational Best Practices for Logging • Operational Best Practices for Monitoring • Operational Best Practices for Serverless	October 22, 2020

Change	Description	Release Date
AWS Config supports new conformance packs	• Operational Best Practices for APRA CPG 234 • Operational Best Practices for FedRAMP(Low) • Operational Best Practices for MAS Notice 655 • Operational Best Practices for NBC TRMG • Operational Best Practices for NCSC Cloud Security Principles • Operational Best Practices for RBI MD-ITF	October 15, 2020

Change	Description	Release Date
AWS Config supports new conformance packs	• Operational Best Practices for ABS CCIG 2.0 Material Workloads • Operational Best Practices for ABS CCIG 2.0 Standard Workloads • Operational Best Practices for BNM RMiT • Operational Best Practices for Data Resiliency • Operational Best Practices for Data Lakes and Analytics Services • Operational Best Practices for Encryption and Key Management • Operational Best Practices for FDA Title 21 CFR Part 11 • Operational Best Practices for Publicly Accessible Resources • Operational Best Practices for MAS TRMG • Operational Best Practices for NERC CIP BCSI • Operational Best Practices for NYDFS 23	October 8, 2020

Change	Description	Release Date
AWS Config supports new conformance packs	• Operational Best Practices for AWS Well-Architected Framework Reliability Pillar • Operational Best Practices for AWS Well-Architected Framework Security Pillar • Operational Best Practices for Compute Services • Operational Best Practices for Databases Services • Operational Best Practices for Management and Governance Services • Operational Best Practices for Networking and Content Delivery Services • Operational Best Practices for Security, Identity, and Compliance Services • Operational Best Practices for Storage Services	October 26, 2020
AWS Config supports new conformance packs	• Operational Best Practices for FedRAMP(Moderate) • Operational Best Practices for FFIEC • Operational Best Practices for HIPAA Security • Operational Best Practices for NIST 800-53 rev 4 • Operational Best Practices for NIST 800 171	September 28, 2020

Change	Description	Release Date
Documentation update	The following conformance pack topics are updated. • Prerequisite for Conformance Packs for AWS Config • Deploying Conformance Packs for AWS Config • Managing Conformance Packs for AWS Config Across all Accounts in Your Organization	September 28, 2020
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • iam-customer-policy-blocked-kms-actions • iam-inline-policy-blocked-kms-actions	September 17, 2020
AWS Config supports AWS WAFv2	With this release, you can use AWS Config to record configura tion changes to your AWS WAFv2 WebACL, IPSet, RegexPatternSet, RuleGroup, and ManagedRuleSet resource types. For more informati on, see Supported Resource Types for AWS Config.	September 1, 2020

Change	Description	Release Date
Documentation update	A note has been added to Full access to AWS Config about creating custom permissions that grant full access. The documentation has been updated for the following rules: • s3-bucket-server-side-encryption-enabled • ec2-instance-detailed-monitoring-enabled • ec2-managedinstance-platform-check	August 24, 2020
Documentation update	Operational Best Practices for PCI DSS 3.2.1 and Operational Best Practices for NIST CSF templates are updated.	August 14, 2020
Documentation update	Example relationship queries are added. For more information, see Example Relationship Queries for AWS Config.	July 30, 2020

Change	Description	Release Date
Documentation update	The following data types are updated: • ConfigurationAggregator • RemediationConfiguration • DescribeOrganizationConfigRules • GetOrganizationConfigRuleDetailedStatus • DescribeOrganizationConfigRuleStatuses • DescribeOrganizationConformancePacks • DescribeOrganizationConformancePackStatuses • GetOrganizationConformancePackDetailedStatus	July 23, 2020
AWS Config supports AWS Systems Manager resource type	With this release, you can use AWS Config to record configuration changes to the AWS Systems Manager file data resource type. For more information, see Supported Resource Types for AWS Config.	July 9, 2020
Documentation update	Operational Best Practices for AWS Identity And Access Management and Operational Best Practices for PCI DSS 3.2.1 templates are updated.	July 9, 2020

Change	Description	Release Date
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • account-part-of-organizations • alb-http-drop-invalid-header-enabled • alb-waf-enabled • cloudfront-default-root-object-configured • cloudfront-origin-access-identity-enabled • cloudfront-origin-failover-enabled • cloudfront-sni-enabled • cloudtrail-security-trail-enabled • cw-loggroup-retention-period-check • dax-encryption-enabled • dynamodb-in-backup-plan • ebs-in-backup-plan • ec2-imdsv2-check • efs-in-backup-plan • eks-endpoint-no-public-access • eks-secrets-encrypted • elasticsearch-node-to-node-encryption-check • elb-cross-zone-load-balancing-enabled • elb-tls-https-listeners-only • iam-no-inline-policy-check	July 9, 2020

Change	Description	Release Date
	• rds-cluster-deletion-protection-enabled • rds-in-backup-plan • rds-instance-deletion-protection-enabled • rds-instance-iam-authentication-enabled • rds-logging-enabled • redshift-backup-enabled • waf-classic-logging-enabled • wafv2-logging-enabled For more information, see List of AWS Config Managed Rules.	
Multi-account multi-region data aggregation Region support	With this release, multi-account multi-region data aggregation is now supported in Asia Pacific (Hong Kong) and Middle East (Bahrain) Regions. For more information, see Multi-Account Multi-Region Data Aggregation and Troubleshooting for Multi-Account Multi-Region Data Aggregation for AWS Config.	July 1, 2020
Advanced queries Region support	With this release, advanced queries is now supported in Asia Pacific (Hong Kong) and Middle East (Bahrain) Regions. For more information, see Querying the Current Configuration State of AWS Resources with AWS Config.	July 1, 2020

Change	Description	Release Date
Documentation update	The documentation has been updated for the following rules: • ec2-managedinstance-association-compliance-status-check • iam-policy-no-statements-with-admin-access • required-tags • restricted-common-ports • rds-snapshots-public-prohibited • s3-bucket-policy-grantee-check	June 30, 2020
Documentation update	The documentation has been updated with information about security for AWS Config. See Security in AWS Config.	June 24, 2020
Documentation update	AWS Control Tower Detective Guardrails Conformance Pack template is updated. For more information, see AWS Control Tower Detective Guardrails Conformance Pack.	June 4, 2020
AWS Config supports a new conformance pack	With this release, AWS Config supports Operational Best Practices for NIST CSF conformance pack. For more information, see Operational Best Practices for NIST CSF.	May 29, 2020

Change	Description	Release Date
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • dynamodb-pitr-enabled • dynamodb-table-encrypted-kms • ec2-ebs-encryption-by-default • rds-snapshot-encrypted • redshift-require-tls-ssl • s3-bucket-default-lock-enabled • s3-default-encryption-kms • securityhub-enabled • sns-encrypted-kms For more information, see List of AWS Config Managed Rules.	May 28, 2020

Change	Description	Release Date
Delegated administrator support	With this release, you can deploy AWS Config rules and conformance packs from any delegated member account in your organization, in addition to the management account. For more information about APIs, see the *AWS Config API Reference*: • PutOrganizationConfigRule • PutOrganizationConformancePack • DescribeOrganizationConfigRules • GetOrganizationConfigRuleDetailedStatus • DescribeOrganizationConfigRuleStatuses • DeleteOrganizationConfigRule • DeleteOrganizationConformancePack • DescribeOrganizationConformancePacks • DescribeOrganizationConformancePackStatuses • GetOrganizationConformancePackDetailedStatus For more information, see Service Limits for AWS Config.	May 27, 2020

Change	Description	Release Date
AWS Config rules Region support	With this release, few AWS Config rules are supported in Africa (Cape Town) and Europe (Milan) regions. For a detailed list of rules and the regions they are supported in, see List of AWS Config Managed Rules.	April 28, 2020
AWS Config supports new conformance packs	With this release, AWS Config supports two conformance packs. • AWS Control Tower Detective Guardrails Conformance Pack • Operational Best Practices for CIS For more information, see Conformance Pack Sample Templates for AWS Config.	April 22, 2020
AWS Config supports AWS Secrets Manager	With this release, you can use AWS Config to record configuration changes to your Secrets Manager secret. For more information, see Supported Resource Types for AWS Config.	April 20, 2020

Change	Description	Release Date
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • secretsmanager-rotation-enabled-check • secretsmanager-scheduled-rotation-success-check For more information, see List of AWS Config Managed Rules.	April 16, 2020
Conformance pack Region support	With this release, conformance packs are now supported in Asia Pacific (Hong Kong) and Middle East (Bahrain). For more information, see Conformance Packs.	April 8, 2020
Documentation update	AWS Config limits are available in this developer guide. For more information, see Service Limits for AWS Config.	April 8, 2020
Documentation update	Third-party resources that are managed (that is, created/updated/deleted) through CloudFormation registry are automatically tracked in AWS Config as configuration items. For more information, see Recording Configurations with AWS Config for Third-Party Resources using the AWS CLI.	March 30, 2020

Change	Description	Release Date
Documentation update	The AWS Config Managed Rules are updated to include AWS Region information. For more information, see List of AWS Config Managed Rules.	March 27, 2020
AWS Config supports Amazon SNS resource type	With this release, you can use AWS Config to record configura tion changes to your Amazon SNS topic. For more information, see Supported Resource Types for AWS Config.	March 6, 2020
Multi-account multi-region data aggregati on Region support	With this release, multi-account multi-region data aggregation is now supported in Europe (Stockhol m) Region. For more information, see Multi-Account Multi-Region Data Aggregation.	March 5, 2020
Advanced queries Region support	With this release, advanced queries is now supported in Europe (Stockholm) Region. For more information, see Querying the Current Configuration State of AWS Resources with AWS Config.	March 5, 2020

Change	Description	Release Date
AWS Config allows you to run advanced queries with configuration aggregators	With this release, AWS Config adds support to run advanced queries based on resource configuration properties with configuration aggregators, enabling you to run the same queries across multiple accounts and Regions. For more information, see Querying the Current Configuration State of AWS Resources with AWS Config. With this release, AWS Config adds `SelectAggregateResourceConfig` API. For more information, see SelectAggregateResourceConfig in the *AWS Config API Reference*:	February 28, 2020
AWS Config supports Amazon SQS resource type	With this release, you can use AWS Config to record configuration changes to your Amazon SQS queue. For more information, see Supported Resource Types for AWS Config.	February 13, 2020

Change	Description	Release Date
AWS CloudFormation support for Conformance packs	With this release, AWS CloudFormation support for the following resources was added: `AWS::Config::ConformancePack` and `OrganizationConformancePack`. • AWS::Config::ConformancePack Use the `AWS::Config::ConformancePack` resource to create a Conformance Pack that is a collection of AWS Config rules that can be easily deployed in an account and a Region and across AWS Organization. • AWS::Config::OrganizationConformancePack Use the `AWS::Config::OrganizationConformancePack` resource to create an Organization Conformance Pack that has information about conformance packs that AWS Config creates in the member accounts.	February 13, 2020

Change	Description	Release Date
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • api-gw-execution-logging-enabled • ec2-stopped-instance • elasticache-redis-cluster-automatic-backup-check • emr-master-no-public-ip • guardduty-non-archived-findings • rds-enhanced-monitoring-enabled • s3-account-level-public-access-blocks • sagemaker-endpoint-configuration-kms-key-configured • service-vpc-endpoint-enabled For more information, see List of AWS Config Managed Rules.	December 20, 2019

Change	Description	Release Date
Record configurations for custom resource types	With this release, AWS Config introduces support to record configurations for custom resource types. You can publish the configuration data of third-party resources into AWS Config and view and monitor the resource inventory and configuration history using AWS Config console and APIs. For more information, see Recording Configurations with AWS Config for Third-Party Resources using the AWS CLI. For more information about APIs, see the *AWS Config API Reference*: • DeleteResourceConfig • PutResourceConfig	November 20, 2019

Change	Description	Release Date
Conformance packs	With this release, AWS Config introduces conformance packs. Conformance packs enable you to package a collection of AWS Config rules and remediation actions that can then be deployed together as a single entity across an entire AWS Organization. For more information, see Conformance Packs. For more information about APIs, see the *AWS Config API Reference*: • DeleteOrganizationConformancePack • DeleteOrganizationConformancePack • DescribeConformancePacks • DescribeConformancePacks • DescribeConformancePackStatus • DescribeOrganizationConformancePacks • DescribeOrganizationConformancePackStatuses • GetConformancePackComplianceDetails • GetConformancePackComplianceSummary • GetOrganizationConformancePackDetailedStatus, • PutConformancePack • PutOrganizationConformancePack	November 19, 2019

Change	Description	Release Date
AWS Config supports Amazon OpenSearch Service and AWS Key Management Service resource types	With this release, you can use AWS Config to record configuration changes to your Amazon OpenSearch Service domain and AWS Key Management Service key. For more information, see Supported Resource Types for AWS Config.	November 11, 2019
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • dms-replication-not-public • emr-kerberos-enabled • internet-gateway-authorized-vpc-only • kms-cmk-not-scheduled-for-deletion • sagemaker-notebook-no-direct-internet-access • sagemaker-notebook-instance-kms-key-configured • shield-drt-access For more information, see List of AWS Config Managed Rules.	October 10, 2019

Change	Description	Release Date
AWS Config supports Amazon RDS resource type	With this release, you can use AWS Config to record configuration changes to your Amazon Relationa l Database Service (Amazon RDS) DBCluster and DBClusterSnapshot. For more information, see Supported Resource Types for AWS Config.	September 17, 2019
AWS Config supports Amazon QLDB resource type	With this release, you can use AWS Config to record configura tion changes to Amazon Quantum Ledger Database (QLDB) ledger resource type. For more information, see Supported Resource Types for AWS Config.	September 10, 2019

Change	Description	Release Date
AWS Config allows you to apply auto remediation on noncompliant resources as evaluated by AWS Config Rules	With this release, AWS Config introduces support to apply auto remediation using AWS Systems Manager automation documents on noncompliant resources as evaluated by AWS Config Rules. For more information, see Remediating Noncompliant Resources with AWS Config. With this release, AWS Config adds the following new APIs. For more information, see the *AWS Config API Reference* : • PutRemediationExceptions • DescribeRemediationExceptions • DeleteRemediationExceptions	September 5, 2019

Change	Description	Release Date
AWS Config updates managed rules	With this release, AWS Config supports the following managed rules: • alb-http-to-https-redirection-check • api-gw-cache-enabled-and-encrypted • api-gw-endpoint-type-check • cloudtrail-s3-dataevents-enabled • cloudwatch-log-group-encrypted • ebs-snapshot-public-restorable-check • elb-deletion-protection-enabled • lambda-concurrency-check • lambda-dlq-check • lambda-inside-vpc • shield-advanced-enabled-autorenew • vpc-vpn-2-tunnels-up For more information, see List of AWS Config Managed Rules.	August 22, 2019

Change	Description	Release Date
AWS Config updates managed rules	With this release, AWS Config updates the following managed rules: • cloudfront-viewer-policy-https • ec2-instance-no-public-ip • ec2-security-group-attached-to-eni • efs-encrypted-check • elasticsearch-encrypted-at-rest • elasticsearch-in-vpc-only • redshift-cluster-public-access-check • vpc-sg-open-only-to-authorized-ports For more information, see List of AWS Config Managed Rules.	July 31, 2019
AWS Config supports Amazon EC2 resource types	With this release, you can use AWS Config to record configuration changes to the following Amazon EC2 resources; VPCEndpoint, VPCEndpointService, and VPCPeeringConnection. For more information, see Supported Resource Types for AWS Config.	July 12, 2019

Change	Description	Release Date
AWS Config allows you to manage AWS Config rules across all AWS accounts within an organization	With this release, AWS Config introduces support for managing AWS Config rules across all AWS accounts within an organization. You can centrally create, update, and delete AWS Config rules across all accounts in your organizat ion. For more information, see Managing AWS Config Rules Across All Accounts in Your Organization. For more information about APIs, see the *AWS Config API Reference*: • PutOrganizationConfigRule • DescribeOrganizationConfigRules • GetOrganizationConfigRuleDe tailedStatus • DescribeOrganizationConfigR uleStatuses • DeleteOrganizationConfigRule	July 9, 2019
AWS Config supports Amazon S3 and Amazon EC2 resource types	With this release, you can use AWS Config to record configura tion changes to the Amazon S3 AccountPublicAccessBlock resource and the following Amazon EC2 resources; NatGateway, EgressOnl yInternetGateway, and FlowLog. For more information, see Supported Resource Types for AWS Config.	May 17, 2019

Change	Description	Release Date
AWS Config updates managed rules	With this release, AWS Config updates the following managed rules: • s3-bucket-public-read-prohibited • s3-bucket-public-write-prohibited For more information, see List of AWS Config Managed Rules.	May 7, 2019
AWS Config allows you to delete a remediati on action using AWS Management Console.	With this release, AWS Config introduces support to delete a remediation action using AWS Management Console. For more information, see Remediating Noncompliant Resources with AWS Config.	April 24, 2019
AWS Config supports new managed rules	This release supports a new managed rule: fms-shield-resource-policy-check. For more information, see List of AWS Config Managed Rules.	April 7, 2019

Change	Description	Release Date
AWS Config supports Amazon API Gateway resource type	With this release, you can use AWS Config to record configuration changes to the following Amazon API Gateway resources; Api (WebSocket API), RestApi (REST API), Stage (WebSocket API stage), and Stage (REST API stage). For more information, see Supported Resource Types for AWS Config.	March 20, 2019
AWS Config allows you to run advanced queries	With this release, AWS Config adds support to run advanced queries based on resource configuration properties. For more information, see Querying the Current Configuration State of AWS Resources with AWS Config. With this release, AWS Config adds `SelectResourceConfig` API. For more information, see SelectResourceConfig in the *AWS Config API Reference*:	March 19, 2019

Change	Description	Release Date
AWS Config allows you to assign tags your AWS Config resources	With this release, AWS Config introduces support for tag based access control for three AWS Config resources—`ConfigRule`, `ConfigurationAggregator`, and `AggregationAuthorization` . For more information, see Tagging Your AWS Config Resources. With this release, you can add, remove or list tags from your AWS Config resources using the following data types. For more information, see the *AWS Config API Reference*: • ListTagsForResource • TagResource • UntagResource	March 14, 2019

Change	Description	Release Date
AWS Config allows you to apply remediation on noncompliant resources as evaluated by AWS Config Rules	With this release, AWS Config introduces support to apply remediation using AWS Systems Manager automation documents on noncompliant resources as evaluated by AWS Config Rules. For more information, see Remediating Noncompliant Resources with AWS Config. With this release, AWS Config adds the following new APIs. For more information, see the *AWS Config API Reference* : • DeleteRemediationConfiguration • DescribeRemediationConfigurations • DescribeRemediationExecutionStatus • PutRemediationConfigurations • StartRemediationExecution	March 12, 2019

Change	Description	Release Date
AWS Config supports AWS Config Rules in China (Ningxia) Region	This release only supports 54 AWS Config Rules in the China (Ningxia) Region. For more information, see List of AWS Config Managed Rules. However, AWS Config does not currently support the following rules in the China (Ningxia) Region: • acm-certificate-expiration-check • cmk-backing-key-rotation-enabled • cloudformation-stack-drift-detection-check • cloudformation-stack-notification-check • cloud-trail-encryption-enabled • cloud-trail-log-file-validation-enabled • codebuild-project-envvar-awscred-check • codebuild-project-source-repo-url-check • codepipeline-deployment-count-check • codepipeline-region-fanout-check • dynamodb-table-encryption-enabled • elb-acm-certificate-required • encrypted-volumes • fms-webacl-resource-policy-check	March 12, 2019

Change	Description	Release Date
	• fms-webacl-rulegroup-association-check • guardduty-enabled-centralized • lambda-function-public-access-prohibited • lambda-function-settings-check • rds-storage-encrypted • root-account-mfa-hardware-mfa-enabled • root-account-mfa-enabled • s3-bucket-blacklisted-actions-prohibited • s3-bucket-policy-grantee-check • s3-bucket-policy-not-more-permissive • s3-bucket-public-read-prohibited • s3-bucket-public-write-prohibited • s3-bucket-server-side-encryption-enabled • s3-bucket-ssl-requests-only	
AWS Config supports new managed rules	This release supports the following new managed rules: • iam-user-mfa-enabled • s3-bucket-policy-grantee-check For more information, see List of AWS Config Managed Rules.	January 21, 2019

Change	Description	Release Date
AWS Config supports Service Catalog resource type	With this release, you can use AWS Config to record configuration changes to the following Service Catalog resources; CloudFromation product, provisioned product, and portfolio. For more information, see Supported Resource Types for AWS Config.	January 11, 2019
Service-linked AWS Config rules support	With this release, AWS Config adds a new managed config rule that supports other AWS services to create AWS Config Rules in your account. For more information, see Service-Linked AWS Config Rules.	November 20, 2018
AWS Config allows you to aggregate configuration data of AWS resources	With this release, AWS Config introduces support for aggregati ng the configuration data of AWS resources. For more information, see Viewing Compliance and Inventory Data in the Aggregator Dashboard for AWS Config. With this release, AWS Config adds the following new APIs. For more information, see the *AWS Config API Reference* : • BatchGetAggregateResourceConfig • GetAggregateDiscoveredResourceCounts • GetAggregateResourceConfig • ListAggregateDiscoveredResources	November 19, 2018

Change	Description	Release Date
AWS Config supports new managed rules	This release supports the following new managed rules: • cloudformation-stack-drift-detection-check • codepipeline-deployment-count-check • codepipeline-region-fanout-check For more information, see List of AWS Config Managed Rules.	November 19, 2018

Change	Description	Release Date
AWS Config supports new managed rules	This release supports the following new managed rules: • access-keys-rotated • cloud-trail-cloud-watch-logs-enabled • cloud-trail-encryption-enabled • cloud-trail-log-file-validation-enabled • cmk-backing-key-rotation-enabled • iam-policy-no-statements-with-admin-access • iam-role-managed-policy-check • iam-root-access-key-check • iam-user-unused-credentials-check • mfa-enabled-for-iam-console-access • multi-region-cloudtrail-enabled • root-account-hardware-mfa-enabled • vpc-flow-logs-enabled For more information, see List of AWS Config Managed Rules.	November 12, 2018

Change	Description	Release Date
AWS Config supports new managed rules	This release supports the following new managed rules: • dynamodb-table-encryption-enabled • elb-logging-enabled • rds-instance-public-access-check • vpc-default-security-group-closed For more information, see List of AWS Config Managed Rules.	October 24, 2018
Compliance history support	With this release, AWS Config now supports storing compliance history of resources as evaluated by AWS Config Rules. For more information, see Viewing Compliance History Timeline for Resources and Rules.	October 18, 2018
Multi-account multi-region Data Aggregation Region support	With this release, multi-account multi-region Data Aggregation is now supported in six new Regions. For more information, see Multi-Account Multi-Region Data Aggregation.	October 4, 2018
AWS Config supports resource-level permissions for AWS Config Rules APIs actions	With this release, AWS Config supports resource-level permissions for certain AWS Config Rules API actions. For more information about the supported APIs, see Supported Resource-Level Permissions for AWS Config Rule API Actions.	October 1, 2018

Change	Description	Release Date
AWS Config supports CodePipeline resource type	With this release, you can use AWS Config to record configuration changes to the AWS CodePipeline resource type. For more information, see Supported Resource Types for AWS Config.	September 12, 2018
AWS Config supports new managed rules	This release supports the following new managed rules: • ec2-instance-managed-by-systems-manager • ec2-managedinstance-association-compliance-status-check • ec2-managedinstance-patch-compliance-status-check • guardduty-enabled-centralized • rds-snapshots-public-prohibited • s3-bucket-blacklisted-actions-prohibited • s3-bucket-policy-not-more-permissive For more information, see List of AWS Config Managed Rules.	September 5, 2018

Change	Description	Release Date
AWS Config supports AWS Systems Manager resource type	With this release, you can use AWS Config to record configuration changes to the AWS Systems Manager patch compliance and association compliance resource types. For more information, see Supported Resource Types for AWS Config.	August 9, 2018
AWS Config allows you to delete your AWS Config data using AWS Management Console	With this release, AWS Config introduces support for retention period using AWS Management Console. In the AWS Management Console, you can select a custom data retention period for your `ConfigurationItems`. For more information, see Deleting AWS Config Data.	August 7, 2018
AWS Config supports AWS Shield resource type	With this release, you can use AWS Config to record configuration changes to the AWS Shield Protection resource type. For more information, see Supported Resource Types for AWS Config.	August 7, 2018
AWS Config supports AWS PrivateLink	With this release, AWS Config supports AWS PrivateLink, enabling you to route data between your Amazon Virtual Private Cloud (VPC) and AWS Config entirely within the AWS network. For more information, see Using AWS Config with Interface Amazon VPC Endpoints.	July 31, 2018

Change	Description	Release Date
AWS Config allows you to delete your AWS Config data	With this release, AWS Config introduces support for retention period. AWS Config allows you to delete your data by specifying a retention period for your `ConfigurationItems`. For more information, see Deleting AWS Config Data. With this release, AWS Config adds the following new APIs. For more information, see the *AWS Config API Reference* : • PutRetentionConfiguration • DescribeRetentionConfigurations • DeleteRetentionConfiguration	May 25, 2018
AWS Config supports new managed rules	This release supports the following two new managed rules: • lambda-function-settings-check • s3-bucket-replication-enabled • iam-policy-blacklisted-check For more information, see List of AWS Config Managed Rules.	May 10, 2018
AWS Config supports AWS X-Ray resource type	With this release, you can use AWS Config to record configuration changes to the AWS X-Ray EncryptionConfig resource type. For more information, see Supported Resource Types for AWS Config.	May 1, 2018

Change	Description	Release Date
AWS Config supports AWS Lambda resource type and one new managed rule	With this release, you can use AWS Config to record configuration changes to the AWS Lambda function resource type. For more information, see Supported Resource Types for AWS Config. This release also supports the lambda-function-public-access-prohibited managed rule. For more information, see AWS Config Managed Rules.	April 25, 2018
AWS Config supports AWS Elastic Beanstalk resource type	With this release, you can use AWS Config to record configuration changes to the AWS Elastic Beanstalk Application, Application Version, and Environment resources. For more information, see Supported Resource Types for AWS Config.	April 24, 2018
AWS Config supports new managed rules	This release supports the following two new managed rules: • fms-webacl-resource-policy-check • fms-webacl-rulegroup-association-check For more information, see List of AWS Config Managed Rules.	April 4, 2018

Change	Description	Release Date
Multi-account multi-region data aggregation	With this release, AWS Config introduces multi-account multi-region data aggregation. This feature allows you to aggregate AWS Config data from multiple accounts or an organization and multiple regions into an aggregator account. For more information, see Multi-Account Multi-Region Data Aggregation. With this release, AWS Config adds the following new APIs. For more information, see the *AWS Config API Reference* : • PutConfigurationAggregator • DescribePendingAggregationRequests • DeletePendingAggregationRequest • PutAggregationAuthorization • DescribeAggregationAuthorizations • GetAggregateConfigRuleComplianceSummary • DescribeAggregateComplianceByConfigRules • GetAggregateComplianceDetailsByConfigRule • DescribeConfigurationAggregators • DescribeConfigurationAggregatorSourcesStatus • DeleteAggregationAuthorization	April 4, 2018

Change	Description	Release Date
	• DeleteConfigurationAggregator	
Monitoring AWS Config with Amazon CloudWatch Events	With this release, use Amazon CloudWatch Events to detect and react to changes in the status of AWS Config events. For more information, see Monitoring AWS Config with Amazon EventBridge.	March 29, 2018
New API operation	With this release, AWS Config adds support for BatchGetResourceConfig API, allowing you to batch-retrieve the current state of one or more of your resources.	March 20, 2018
AWS Config supports AWS WAF RuleGroup resource type	With this release, you can use AWS Config to record configuration changes to the AWS WAF RuleGroup and AWS WAF RuleGroup Regional resources. For more information, see Supported Resource Types for AWS Config.	February 15, 2018

Change	Description	Release Date
AWS Config supports new managed rules	This release supports the following new managed rules: • elb-acm-certificate-required • elb-custom-security-policy-ssl-check • elb-predefined-security-policy-ssl-check • codebuild-project-envvar-awscred-check • codebuild-project-source-repo-url-check • iam-group-has-users-check • s3-bucket-server-side-encryption-enabled For more information, see List of AWS Config Managed Rules.	January 25, 2018
AWS Config supports Elastic Load Balancing resource type	With this release, you can use AWS Config to record configuration changes to your Elastic Load Balancing classic load balancers. For more information, see Supported Resource Types for AWS Config.	November 17, 2017

Change	Description	Release Date
AWS Config supports the Amazon CloudFront and AWS WAF resource type	With this release, you can use AWS Config to record configuration changes to your CloudFront distribut ion and streaming distribution. With this release, you can use AWS Config to record configuration changes to the following AWS WAF and AWS WAF Regional resources; rate based rule, rule, and Web ACL. For more information, see Supported Resource Types for AWS Config.	November 15, 2017
AWS Config supports the AWS CodeBuild resource type	With this release, you can use AWS Config to record configuration changes to your AWS CodeBuild projects. For more information, see Supported Resource Types for AWS Config.	October 20, 2017

Change	Description	Release Date
AWS Config supports Auto Scaling resources and one new managed rule	With this release, you can use AWS Config to record configuration changes to the following Auto Scaling resources; groups, launch configuration, scheduled action, and scaling policy. For more information, see Supported Resource Types for AWS Config. This release also supports the following managed rule: • autoscaling-group-elb-healthcheck-required For more information, see AWS Config Managed Rules.	September 18, 2017
AWS Config supports the AWS CodeBuild resource type	With this release, you can use AWS Config to record configuration changes to your AWS CodeBuild projects. For more information, see Supported Resource Types for AWS Config.	October 20, 2017

Change	Description	Release Date
AWS Config supports Auto Scaling resources and one new managed rule	With this release, you can use AWS Config to record configuration changes to the following Auto Scaling resources; groups, launch configuration, scheduled action, and scaling policy. For more information, see Supported Resource Types for AWS Config. This release also supports the following managed rule: • autoscaling-group-elb-healthcheck-required For more information, see AWS Config Managed Rules.	September 18, 2017
AWS Config supports the DynamoDB table resource type and one new managed rule	With this release, you can use AWS Config to record configuration changes to your DynamoDB tables. For more information, see Supported Resource Types for AWS Config. This release supports the following managed rule: • dynamodb-autoscaling-enabled For more information, see AWS Config Managed Rules.	September 8, 2017

Change	Description	Release Date
AWS Config supports two new managed rules for Amazon S3	This release supports two new managed rules: • s3-bucket-public-read-prohibited • s3-bucket-public-write-prohibited For more information, see AWS Config Managed Rules.	August 14, 2017
New page in the AWS Config console	You can use the **Dashboard** in the AWS Config console to see the following: • Total number of resources • Total number of rules • Number of noncompliant resources • Number of noncompliant rules For more information, see Viewing the AWS Config Dashboard.	July 17, 2017
New API operation	You can use the GetDiscoveredResourceCounts operation to return the number of resource types, the number of each resource type, and the total number of resources that AWS Config is recording in a Region for your AWS account.	July 17, 2017

Change	Description	Release Date
AWS Config supports the CloudFormation stack resource type and one new managed rule	With this release, you can use AWS Config to record configuration changes to your CloudFormation stacks. For more information, see Supported Resource Types for AWS Config. This release supports the following managed rule: • cloudformation-stack-notification-check For more information, see AWS Config Managed Rules.	July 6, 2017
New and updated content	This release adds support for AWS Config Rules in the Canada (Central) Region and South America (São Paulo) Region. For all regions that support AWS Config and Config Rules, see AWS Regions and Endpoints in the *AWS General Reference*.	July 5, 2017

Change	Description	Release Date
New and updated content	AWS Config Rules is available in the AWS GovCloud (US) Region. For more information, see the AWS GovCloud (US) User Guide. For regions that support AWS Config, see AWS Regions and Endpoints in the *AWS General Reference*.	June 8, 2017
AWS Config supports the Amazon CloudWatch alarm resource type and three new managed rules	With this release, you can use AWS Config to record configuration changes to your Amazon CloudWatch alarms. For more information, see Supported Resource Types for AWS Config. This release supports three new managed rules: • cloudwatch-alarm-action-check • cloudwatch-alarm-resource-check • cloudwatch-alarm-settings-check For more information, see AWS Config Managed Rules.	June 1, 2017

Change	Description	Release Date
New and updated content	This release supports specifying the application version number for the following managed rules: • ec2-managedinstance-applications-blacklisted • ec2-managedinstance-applications-required For more information, see AWS Config Managed Rules.	June 1, 2017
New and updated content	This release adds support for AWS Config Rules in the Asia Pacific (Mumbai) Region. For more information, see AWS Regions and Endpoints in the *AWS General Reference*.	April 27, 2017
New and updated content	This release supports an updated console experience for adding AWS Config managed rules to your account for the first time. When you set up AWS Config Rules for the first time or in a new Region, you can search for AWS managed rules by name, description, or label. You can choose **Select all** to select all rules or choose **Clear all** to clear all rules. For more information, see Add, View, Update and Delete Rules (Console).	April 5, 2017

Change	Description	Release Date
AWS Config supports new managed rules	This release supports the following new managed rules: • acm-certificate-expiration-check • ec2-instance-detailed-monitoring-enabled • ec2-managedinstance-inventory-blacklisted • ec2-volume-inuse-check • iam-user-group-membership-check • iam-user-no-policies-check • s3-bucket-ssl-requests-only For more information, see List of AWS Config Managed Rules.	February 21, 2017
New and updated content	This release adds support for AWS Config Rules in the Europe (London) Region. For more information, see AWS Regions and Endpoints in the *AWS General Reference*.	February 21, 2017
New and updated content	This release adds CloudFormation templates for AWS Config managed rules. You can use the templates to create managed rules for your account. For more information, see Creating AWS Config Managed Rules With AWS CloudFormation Templates.	February 16, 2017

Change	Description	Release Date
New and updated content	This release adds support for a new test mode for the `PutEvaluations` API. Set the `TestMode` parameter to true in your custom rule to verify whether your AWS Lambda function will deliver evaluation results to AWS Config. No updates occur to your existing evaluations, and evaluation results are not sent to AWS Config. For more information, see PutEvaluations in the *AWS Config API Reference*.	February 16, 2017
New and updated content	This release adds support for AWS Config Rules in the Asia Pacific (Seoul), and US West (N. California) Regions. For more information, see AWS Regions and Endpoints in the *AWS General Reference*.	December 21, 2016
New and updated content	This release adds support for AWS Config in the Europe (London) Region. For more information, see AWS Regions and Endpoints in the *AWS General Reference*.	December 13, 2016
New and updated content	This release adds support for AWS Config in the Canada (Central) Region. For more information, see AWS Regions and Endpoints in the *AWS General Reference*.	December 8, 2016

Change	Description	Release Date
AWS Config supports Amazon Redshift resource types and two new managed rules	With this release, you can use AWS Config to record configuration changes to your Amazon Redshift clusters, cluster parameter groups, cluster security groups, cluster snapshots, cluster subnet groups, and event subscriptions. For more information, see Supported Resource Types for AWS Config. This release supports two new managed rules: • redshift-cluster-configuration-check • redshift-cluster-maintenancesettings-check For more information, see List of AWS Config Managed Rules.	December 7, 2016
New and updated content	This release adds support for a new managed rule: • dynamodb-throughput-limit-check For more information, see List of AWS Config Managed Rules.	December 7, 2016

Change	Description	Release Date
New and updated content	This release adds support for creating up to 50 rules per Region in an account. For more information, see AWS Config Limits in the *AWS General Reference*.	December 7, 2016
AWS Config supports the managed instance inventory resource type for Amazon EC2 Systems Manager and three new managed rules	With this release, you can use AWS Config to record software configuration changes on your managed instances with support for managed instance inventory. For more information, see Recording Software Configuration for Managed Instances. This release supports three new managed rules: • ec2-managedinstance-inventory-blacklisted • ec2-managedinstance-applications-required • ec2-managedinstance-platform-check For more information, see List of AWS Config Managed Rules.	December 1, 2016
New and updated content	AWS Config is available in the China (Beijing) Region.	October 24, 2016

Change	Description	Release Date
AWS Config supports the Amazon S3 bucket resource and two new managed rules	With this release, you can use AWS Config to record configura tion changes to your Amazon S3 buckets. For more information, see Supported Resource Types for AWS Config. This release supports two new managed rules: • s3-bucket-logging-enabled • s3-bucket-versioning-enabled For more information, see AWS Config Managed Rules.	October 18, 2016
New and updated content	This release adds support for AWS Config and AWS Config Rules in the US East (Ohio) Region. For more information, see AWS Regions and Endpoints in the *AWS General Reference*.	October 17, 2016

Change	Description	Release Date
New and updated managed rules	This update adds support for eight new managed rules: • approved-amis-by-id • approved-amis-by-tag • db-instance-backup-enabled • desired-instance-type • ebs-optimized-instance • iam-password-policy • rds-multi-az-support • rds-storage-encrypted You can specify multiple parameter values for the following rules: • desired-instance-tenancy • required-tags For more information, see List of AWS Config Managed Rules.	October 4, 2016
New and updated content for the AWS Config console	This update adds support for viewing AWS CloudTrail API activity in the AWS Config timeline. If CloudTrail is logging for your account, you can view create, update, and delete API events for configuration changes to your resources. For more information, see Viewing Compliance History for your AWS Resources with AWS Config.	September 06, 2016

Change	Description	Release Date
AWS Config supports Elastic Load Balancing resource type	With this release, you can use AWS Config to record configura tion changes to your Elastic Load Balancing application load balancers. For more information, see Supported Resource Types for AWS Config.	August 31, 2016
New and updated content	This release adds support for AWS Config Rules in the Asia Pacific (Singapore), and Asia Pacific (Sydney) Regions. For more information, see AWS Regions and Endpoints in the *AWS General Reference*.	August 18, 2016
New and updated content for AWS Config Rules	This update adds support for creating a rule that can be triggered by both configuration changes and at a periodic frequency that you choose. For more information, see Components of an AWS Config Rule. This update also adds support for manually evaluating your resources against your rule and deleting evaluation results. For more information, see Evaluating Your Resources with AWS Config Rules. This update also adds support for evaluating additional resource types using custom rules.	July 25, 2016

Change	Description	Release Date
AWS Config supports Amazon RDS and AWS Certificate Manager (ACM) resource types	With this release, you can use AWS Config to record configuration changes to your Amazon Relational Database Service (Amazon RDS) DB instances, DB security groups, DB snapshots, DB subnet groups, and event subscriptions. You can also use AWS Config to record configuration changes to certificates provided by ACM. For more information, see Supported Resource Types for AWS Config.	July 21, 2016
Updated information about managing the configura tion recorder	This update adds steps for renaming and deleting the configuration recorder to Working with the configuration recorder.	July 07, 2016
Simplified role creation and updated policies	With this update, creating an IAM role for AWS Config is simplified. This enhancement is available in regions that support Config rules. To support this enhancement, the steps in Setting Up AWS Config with the Console are updated, the example policy in Permissions for the Amazon S3 Bucket for the AWS Config Delivery Channel is updated, and the example policy in Identity-based policy examples for AWS Config is updated.	March 31, 2016

Change	Description	Release Date
Example functions and events for Config rules	This update provides updated example functions.	March 29, 2016
AWS Config Rules GitHub repository	This update adds information about the AWS Config Rules GitHub repository to Evaluating Resources with AWS Config Rules. This repository provides sample functions for custom rules that are developed and contributed by AWS Config users.	March 1, 2016
AWS Config Rules	This release introduces AWS Config Rules. With rules, you can use AWS Config to evaluate whether your AWS resources comply with your desired configurations. For more information, see Evaluating Resources with AWS Config Rules.	December 18, 2015
AWS Config supports IAM resource types	With this release, you can use AWS Config to record configuration changes to your IAM users, groups, roles, and customer managed policies. For more information, see Supported Resource Types for AWS Config.	December 10, 2015

Change	Description	Release Date
AWS Config supports EC2 Dedicated host	With this release, you can use AWS Config to record configuration changes to your EC2 Dedicated hosts. For more information, see Supported Resource Types for AWS Config.	November 23, 2015
Updated permissions information	This update adds information about the following AWS managed policies for AWS Config: • `AWS_ConfigRole` – Grants AWS Config permission to get configuration details about your resources. For more information, see IAM Role Policy for Getting Configuration Details. • `AWSConfigUserAccess` – Grants read-only access to an AWS Config user. For more information, see Read-only access to AWS Config.	October 19, 2015
AWS Config Rules preview	This release introduces the AWS Config Rules preview. With rules, you can use AWS Config to evaluate whether your AWS resources comply with your desired configurations. For more information, see Evaluating Resources with AWS Config Rules.	October 7, 2015

Change	Description	Release Date
New and updated content	This release adds the ability to look up resources that AWS Config has discovered. For more information, see Looking Up Resources That Are Discovered by AWS Config.	August 27, 2015
New and updated content	This release adds the ability to select which resource types AWS Config records. For more information, see Recording AWS Resources with AWS Config.	June 23, 2015
New and updated content	This release adds support for the following regions: Asia Pacific (Tokyo), Asia Pacific (Singapore), Europe (Frankfurt), South America (São Paulo), and US West (N. California). For more information, see AWS Regions and Endpoints.	April 6, 2015
New guide	This release introduces AWS Config.	November 12, 2014
