Vulkan?

Managing Complexity

- Great Flexibility
- Expensive to rewrite large amounts of code

- Greatest breadth and impact
- Sensitive to quality and performance

Tremendous leverage!

Observations

- Vulkan and SPIR-V today are sufficient to host compute shaders written in novel languages
- In the App+Driver+Compiler triad, the compiler has huge advantages!
- Clspv has allowed us to compile several hundred thousand lines of OpenCL C code to SPIR-V (graphics) with minimal changes
- The Clspv experience revealed coverage gaps in Vulkan CTS
 - We have improved CTS coverage
 - Compilers are remarkably agile for working around bugs in drivers
- Clspv is today an insanely useful prototype with which I'm building a commercial Android product

Project Rush – Unveiled at VidCon 2018
